

# How Wide is the Higgs Boson: off-shell constraints from CMS

Andrei Gritsan

Johns Hopkins University

May 29, 2014

SLAC Experimental Seminar

# Overview

- Introduction
- The Higgs boson
- How we see it
- Off-shell production
- Data analysis

$$- H \rightarrow Z^* Z^* \rightarrow 4\ell$$

$$- H^* \rightarrow ZZ \rightarrow 4\ell$$

$$- H^* \rightarrow ZZ \rightarrow 2\ell 2\nu$$

- Theoretical considerations
- Summary and outlook

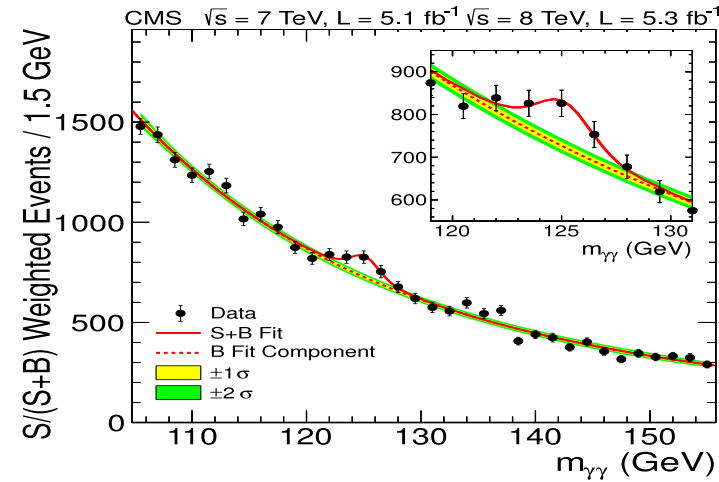

A FEW SLIDES OF HISTORY

# July 2012: Observation of a New Boson

- Observation of a New Boson on CMS:  $5\sigma$  excess

$$X \rightarrow Z^{(*)} Z^{(*)}$$

$$X \rightarrow \gamma\gamma$$

- Probability of background  $\sim 0.2 \times 10^{-6}$

# July 2012: Observation of a New Boson

- Observation of a New Boson on ATLAS:  $5\sigma$  excess

$$X \rightarrow Z^{(*)} Z^{(*)}$$

$$X \rightarrow \gamma\gamma$$

- Probability of background

$$\sim 0.2 \times 10^{-6}$$

# The Higgs Boson Signal on CMS

- Excellent signal  $H \rightarrow ZZ, WW, \gamma\gamma, \tau^+\tau^-, b\bar{b}$   
6.8, 4.3, 3.2, 3.2,  $2.1\sigma$   
(6.7, 5.8, 3.9, 3.7,  $2.1\sigma$  expected)

# Discovery of a Higgs Boson

---

- Discovery of a Higgs Boson

- absolutely new form of **matter-energy**
- consistent with fundamental  $J^P = 0^+$   
**scalar** excitation of a **vacuum** field

- It would be foolish to stop here

- **mass** (is Universe stable, are EW data consistent?..)
- **width** / **lifetime** (are there missing final states?)
- **quantum numbers** (is there  $CP$  violation?..)
- coupling strength in **production** and **decay** (is it the right Higgs?..)

- It is also a triumph of **predictive power** of scientific knowledge

- we knew where to look
- but a discovery was **not guaranteed**, also true for the **next steps**

# The Higgs $\rightarrow ZZ \rightarrow 4\ell$ Signal on CMS

# The Higgs $\rightarrow ZZ \rightarrow 4\ell$ Signal on CMS

# The Higgs $\rightarrow ZZ \rightarrow 4\ell$ Signal on CMS

# The Large Hadron Collider

# The CMS Detector

---

- Complex detector to sort collision debris out

# The CMS Detector

Total weight 12500 T

Diameter 15 m

Length 22 m

Magnetic field 4 T

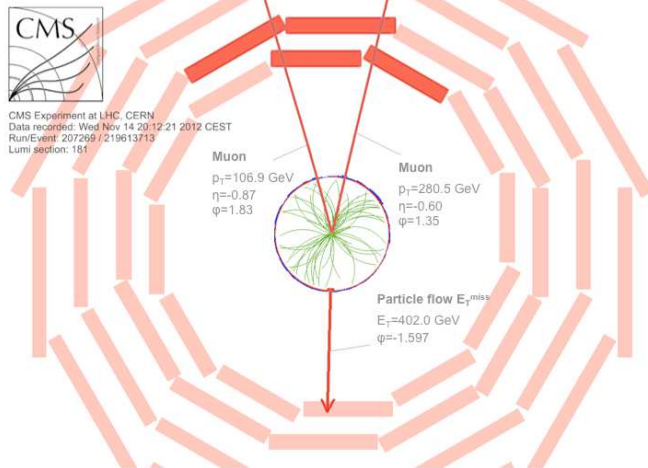

# The Experiment

# Detection of Major Objects

- Leptons:  $\ell^\pm$  in Si Tracker:  $e^\pm$  (EM Calorimeter),  $\mu^\pm$  (Muon System)
- Photons:  $\gamma$  (EM Calorimeter)
- Quark  $q$  & gluon  $g$  jets  $\rightarrow$  "Particle Flow" thru Hadronic Calorimeter
- Neutrinos  $\nu \Rightarrow$  missing energy ("MET")

$$ZZ \rightarrow (\mu^+ \mu^-)(\nu \bar{\nu})$$

# Production and Decay of a Higgs Boson

- Excite vacuum:  $gg, \text{VBF}, \dots \rightarrow H \rightarrow ZZ^{(*)}, WW^{(*)}, \gamma\gamma, \tau^+\tau^-, b\bar{b}, \dots$

# Signal and Background

- At LHC might have produced  $> 200000$  Higgs bosons / experiment

gluon fusion

weak boson fusion

associated production

- The challenge is to distinguish **signal** from **backgrounds**, examples:

$$q\bar{q} \rightarrow ZZ^{(*)}(\gamma^{(*)})$$

$$q\bar{q} \rightarrow Z(\gamma) + \text{jets}$$

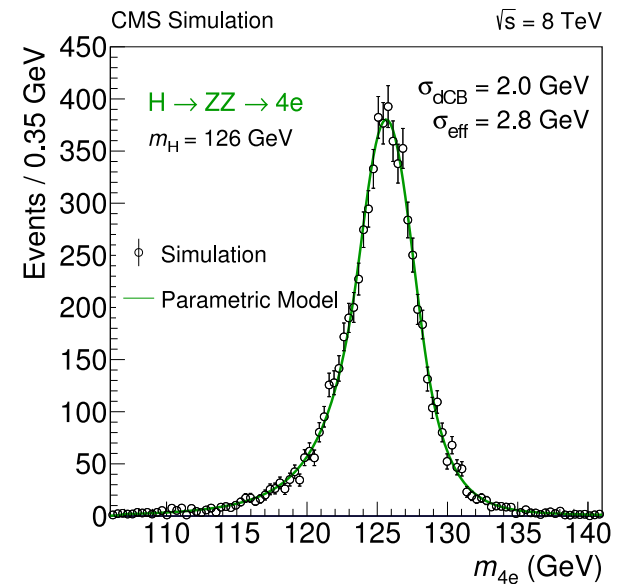

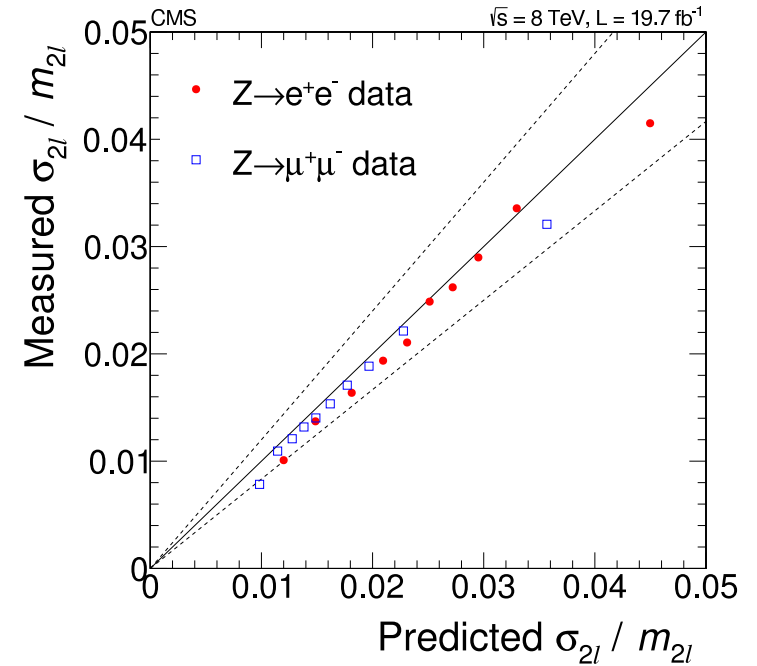

$$gg \rightarrow t\bar{t}$$

# Track / Mass Resolution

- $H \rightarrow ZZ \rightarrow (l^+l^-)(l^+l^-)$ 
  - excellent mass resolution  $\sim 1\%$
  - good control with  $Z, J/\psi \rightarrow l^+l^-$
  - measure mass  $m_H$  and width  $\Gamma_H$

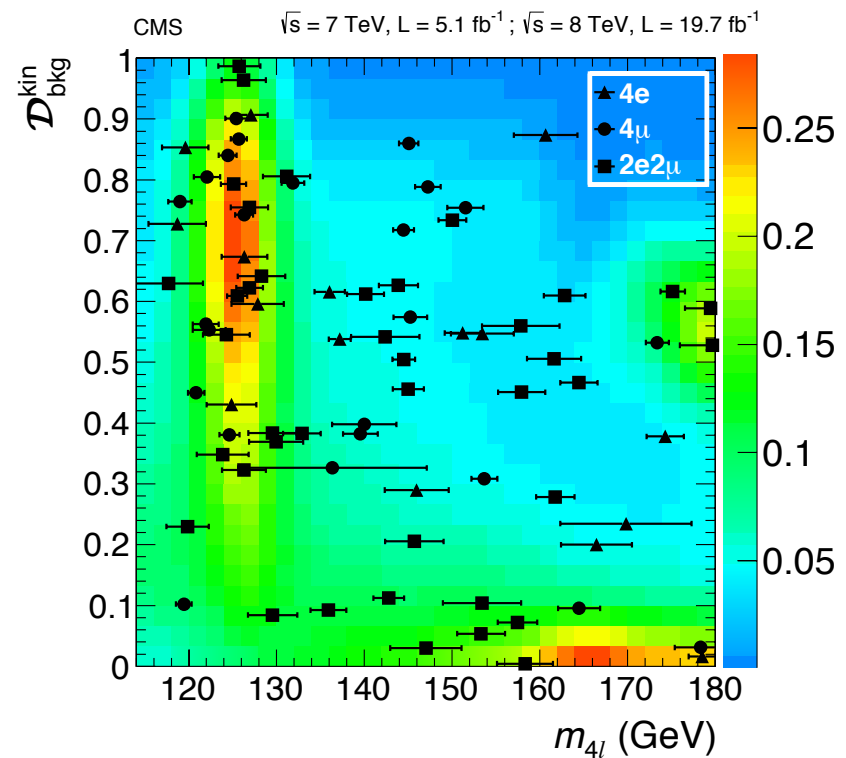

# Fit mass and width of Higgs $\rightarrow ZZ \rightarrow 4\ell$

- Employ a 3D fit

$m_{4\ell}$  – invariant mass

$\mathcal{D}_{\text{bkg}}^{\text{kin}}$  – MELA (matrix element likelihood) to suppress background

$\delta m_{4\ell}$  – per-event error estimate on invariant mass

# Test with $Z \rightarrow 4\ell$

- Excellent candle  $Z \rightarrow \ell^+\ell^-\gamma^* \rightarrow \ell^+\ell^-\ell^+\ell^-$

$$m_Z = 91.12 \pm 0.37 \text{ GeV} \quad (\text{compare PDG } 91.19 \text{ GeV})$$

$$\Gamma_Z = 3.6^{+1.0}_{-0.8} \text{ GeV} \quad (\text{compare PDG } 2.50 \text{ GeV})$$

# Mass H(126)

- Employ a 3D fit

$$m_H = 125.6 \pm 0.4 \text{ (stat.)} \pm 0.2 \text{ (syst.) GeV}$$

# Width H(126)

- Employ a 3D fit

$$\Gamma_H = 0.0_{-0.0}^{+1.3} \text{ GeV} < 3.4 \text{ GeV at 95\% CL}$$

expect  $\Gamma_H^{\text{SM}} = 0.00415 \text{ GeV}$  at  $m_H = 125.6 \text{ GeV}$

CAN WE DO BETTER?

# Off-shell effects

- $m_H = 125.6 \text{ GeV} < 2 m_Z = 182.4 \text{ GeV}$

$\Rightarrow H \rightarrow Z^{(*)} Z^*$  with off-shell  $Z^* \Rightarrow$  **suppression**

- Higgs boson remains on shell

$$\frac{d\sigma_{gg \rightarrow H \rightarrow ZZ}}{dm_{ZZ}^2} \sim \frac{g_{ggH}^2 g_{HZZ}^2}{(m_{ZZ}^2 - m_H^2)^2 + m_H^2 \Gamma_H^2}$$

# Higgs off-shell effects

- Sizeable off shell  $H$

$$gg \rightarrow H \rightarrow Z^{(*)} Z^*$$

on shell  $H$ , suppressed  $Z^*$

$$gg \rightarrow H^* \rightarrow ZZ$$

suppressed  $H^*$ , on shell  $Z$

N. Kauer, G. Passarino  
arXiv:1206.4803 [hep-ph]

MC: gg2VV, LO in QCD

	Tot [pb]	$m_{ZZ} > 2m_Z$ [pb]	R[%]
$gg \rightarrow H \rightarrow \text{all}$	19.146	0.1525	0.8
$gg \rightarrow H \rightarrow ZZ$	0.5462	0.0416	7.6

# Higgs boson width from off-shell production

$$\frac{d\sigma_{gg \rightarrow H \rightarrow ZZ}}{dm_{ZZ}^2} \sim \frac{g_{ggH}^2 g_{HZZ}^2}{(m_{ZZ}^2 - m_H^2)^2 + m_H^2 \Gamma_H^2}$$

- On peak ( $m_{ZZ} \sim m_H$ ) and off peak ( $m_{ZZ} - m_H \gg \Gamma_H$ )

F. Caola, K. Melnikov: arXiv:1307.4935 [hep-ph]

$$\sigma_{gg \rightarrow H \rightarrow ZZ}^{\text{onpeak}} = \text{const} \frac{g_{ggH}^2 g_{HZZ}^2}{\Gamma_H} \quad \sigma_{gg \rightarrow H \rightarrow ZZ}^{\text{offpeak}} = \text{const}' g_{ggH}^2 g_{HZZ}^2$$

$\Rightarrow$  measurement of  $\Gamma_H$

- Complication: signal - background **destructive interference**

# Higgs boson width from off-shell production

$$\sigma_{gg \rightarrow H \rightarrow ZZ}^{\text{onpeak}} = \text{const} \frac{g_{ggH}^2 g_{HZZ}^2}{\Gamma_H} \quad \sigma_{gg \rightarrow H \rightarrow ZZ}^{\text{offpeak}} = \text{const}' g_{ggH}^2 g_{HZZ}^2$$

- Given the signal strength at the peak  $\mu = \sigma/\sigma_{\text{SM}}$

$\Rightarrow$  off-shell signal  $\propto \Gamma_H$ , interference  $\propto \sqrt{\Gamma_H}$

# Monte Carlo Simulation (off shell)

- $gg \rightarrow ZZ^{(*)}/Z\gamma^{*}$  gg2VV and

  - $H \rightarrow VV \rightarrow 4f$  decay JHUGen
  - anomalous couplings with JHUGen  
spin-0, 1, 2,  $q\bar{q}$ ,  $gg$ , VBF,  $VH$ ,  $H2j$
- Dominant  $q\bar{q} \rightarrow ZZ$  background
  - NLO QCD POWHEG
  - NLO EW re-weighting  
follow [arXiv:1307.4331](#), [arXiv:1305.5402](#)
  - (5 – 10)% in 220 – 500 GeV range
  - ~ 40% uncertainty on the correction

# Use Kinematics to Suppress Background

- One challenge is the dominant  $q\bar{q} \rightarrow ZZ$  background

- Follow the same approach as at the Higgs discovery

MELA technique

(Matrix Element Likelihood Approach)

to suppress  $q\bar{q} \rightarrow ZZ$

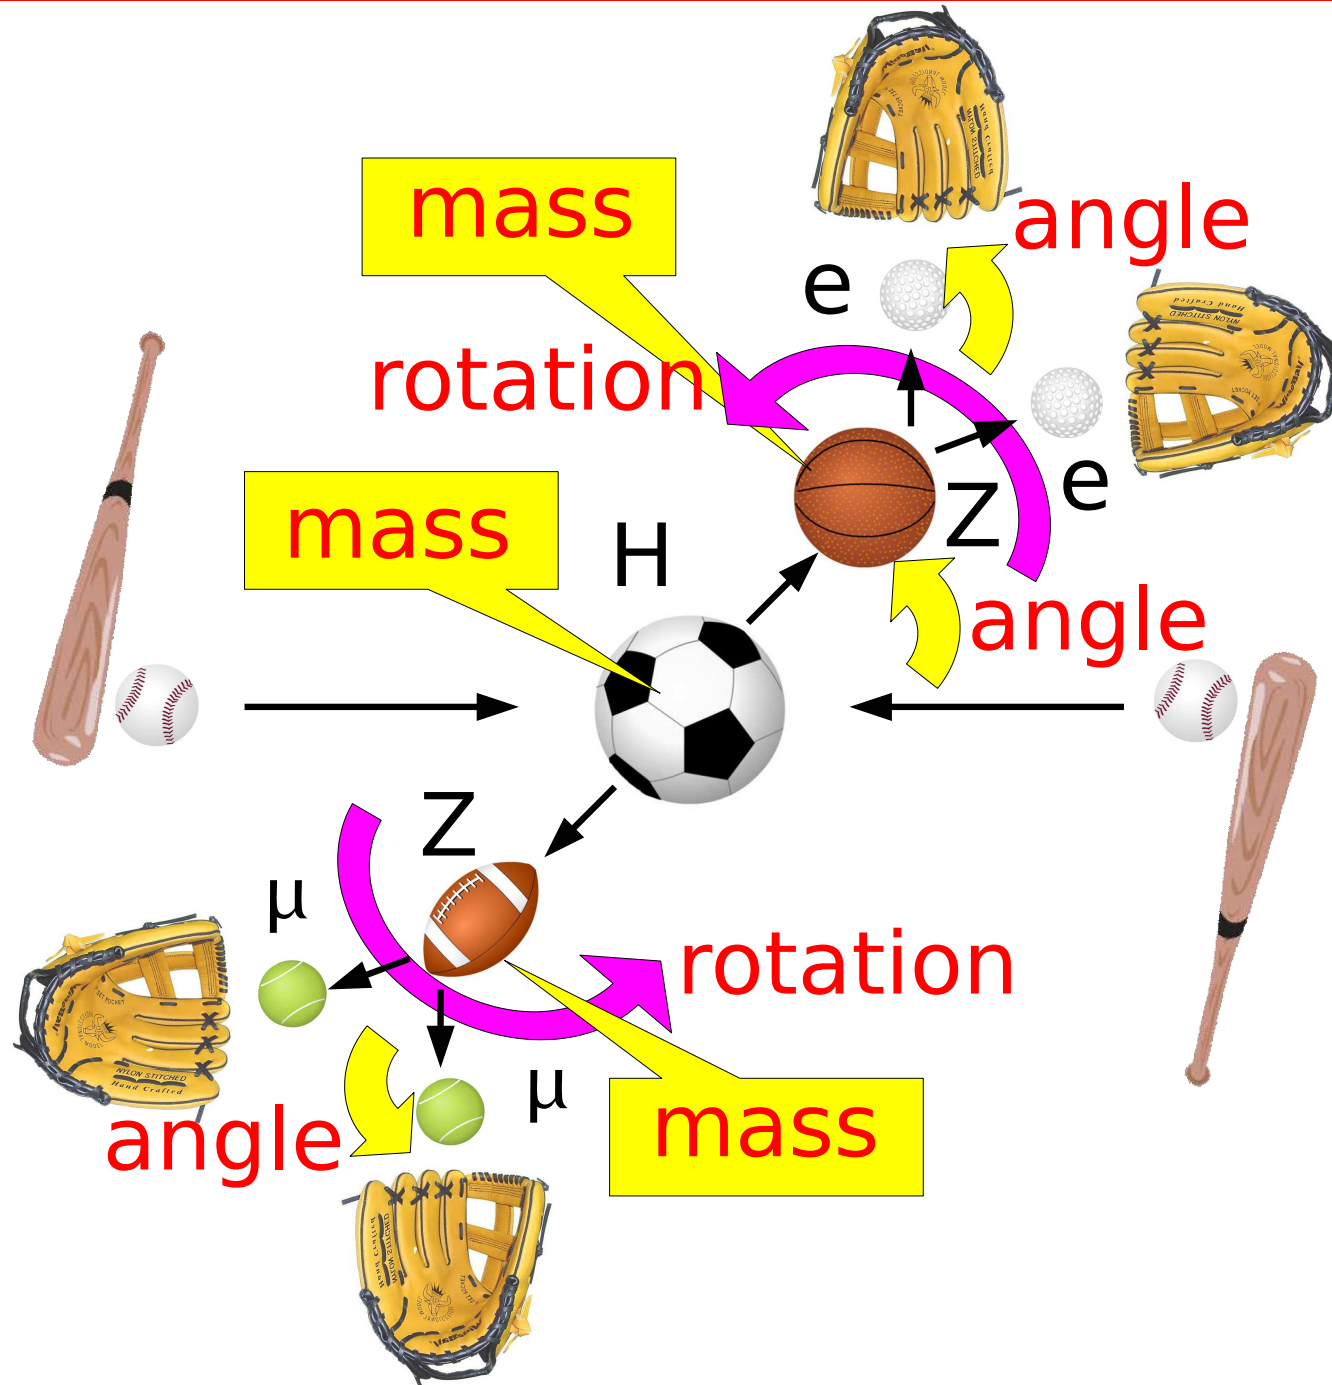

vs  $gg \rightarrow \dots \rightarrow ZZ$

# Matrix Element Likelihood Approach

# Matrix Element Likelihood Approach

# Matrix Element Likelihood Approach

- Optimal discriminant to separate  $gg \rightarrow ZZ$  vs  $q\bar{q} \rightarrow ZZ$

$$\mathcal{D}_{gg} = \frac{\mathcal{P}_{\text{tot}}^{gg}}{\mathcal{P}_{\text{tot}}^{gg} + \mathcal{P}_{\text{bkg}}^{q\bar{q}}} = \left[ 1 + \frac{\mathcal{P}_{\text{bkg}}^{q\bar{q}}}{10 \times \mathcal{P}_{\text{sig}}^{gg} + \sqrt{10} \times \mathcal{P}_{\text{int}}^{gg} + \mathcal{P}_{\text{bkg}}^{gg}} \right]^{-1}$$

MCFM - continuum, JHUGen - onpeak signal, analytical

- Higgs discovery:

$$\mathcal{D}_{\text{bkg}}^{\text{kin}} = \frac{\mathcal{P}_{0+}}{\mathcal{P}_{0+} + \mathcal{P}_{\text{bkg}}^{q\bar{q}}}$$

- Higgs spin-parity:

$$\mathcal{D}_{JP} = \frac{\mathcal{P}_{0+}}{\mathcal{P}_{0+} + \mathcal{P}_{JP}}$$

# Kinematics

- MELA  $\mathcal{D}_{gg}(m_{ZZ}, m_{Z1}, m_{Z2}, \cos \theta_1, \cos \theta_2, \cos \theta^*, \Phi, \Phi_1)$

# $H^* \rightarrow ZZ \rightarrow 4\ell$ Mass after Kinematic Selection

- Optimal use of kinematic information

before

after  $\mathcal{D}_{gg} > 0.65$

# Semileptonic Channel $H \rightarrow ZZ \rightarrow 2\ell 2\nu$

- Partial reco, but  $\times 5.5$  higher branching

$\Rightarrow$  comparable to  $4\ell$  sensitivity **at high mass**

but no hope **at low mass** (overwhelmed with  $Z$ +jets background)

$$m_T^2 = \left[ \sqrt{p_{T,2\ell}^2 + m_{2\ell}^2} + \sqrt{E_T^{\text{miss}^2} + m_{2\ell}^2} \right]^2 - \left[ \vec{p}_{T,2\ell} + \vec{E}_T^{\text{miss}} \right]^2$$

# Semileptonic Channel $H \rightarrow ZZ \rightarrow 2\ell 2\nu$

- Partial reco, but  $\times 5.5$  higher branching

$\Rightarrow$  comparable to  $4\ell$  sensitivity **at high mass**

but no hope **at low mass** (overwhelmed with  $Z$ +jets background)

$$m_T^2 = \left[ \sqrt{p_{T,2\ell}^2 + m_{2\ell}^2} + \sqrt{E_T^{\text{miss}^2} + m_{2\ell}^2} \right]^2 - \left[ \vec{p}_{T,2\ell} + \vec{E}_T^{\text{miss}} \right]^2$$

# Look at enhanced signal region

- For illustration purpose define the enhanced signal regions

$$H \rightarrow ZZ \rightarrow 4\ell$$

$$H \rightarrow ZZ \rightarrow 2\ell 2\nu$$

$$m_{4\ell} > 330 \text{ GeV}, \mathcal{D}_{gg} > 0.65$$

$$m_T > 350 \text{ GeV}, E_T^{\text{miss}} > 100 \text{ GeV}$$

# Enhanced signal $H \rightarrow ZZ \rightarrow 4\ell$ and $2\ell 2\nu$

# How to Extract the Width

- Relative size of low and high mass Higgs signal
  - analysis at high mass  $\Rightarrow g_{ggH} g_{HZZ}$  ( $gg \rightarrow H$ ) or  $g_{HVV} g_{HZZ}$  (VBF)
  - must relate to on-peak to measure  $\Gamma$
- Composition of production:  $gg \rightarrow H$  vs VBF
  - need to know to describe the shape
- Is the coupling  $g_{HVV}(m_{ZZ})$  running (anomalous)?

# Extracting the Width

- Determine strength and production composition from the peak
  - $\mu_{ggH}$  and  $\mu_{\text{VBF}}$  provide both (ratio to SM  $\mu = \sigma/\sigma_{\text{SM}}$ )

$$\mathcal{P}_{\text{tot}}^{\text{onshell}}(\vec{x}) = \mu_{ggH} \times [\mathcal{P}_{\text{sig}}^{gg}(\vec{x}) + \mathcal{P}_{\text{sig}}^{t\bar{t}H}(\vec{x})] + \mu_{\text{VBF}} \times [\mathcal{P}_{\text{sig}}^{\text{VBF}}(\vec{x}) + \mathcal{P}_{\text{sig}}^{\text{VH}}(\vec{x})] \\ + \mathcal{P}_{\text{bkg}}^{q\bar{q}}(\vec{x}) + \mathcal{P}_{\text{bkg}}^{gg}(\vec{x}) + \dots$$

- Relate to high mass
  - $\Gamma_H$  is the only free parameter remaining

$$\mathcal{P}_{\text{tot}}^{\text{offshell}}(\vec{x}) = \left[ \mu_{ggH} \times \frac{\Gamma_H}{\Gamma_0} \times \mathcal{P}_{\text{sig}}^{gg}(\vec{x}) + \sqrt{\mu_{ggH} \times \frac{\Gamma_H}{\Gamma_0}} \times \mathcal{P}_{\text{int}}^{gg}(\vec{x}) + \mathcal{P}_{\text{bkg}}^{gg}(\vec{x}) \right] \\ + \left[ \mu_{\text{VBF}} \times \frac{\Gamma_H}{\Gamma_0} \times \mathcal{P}_{\text{sig}}^{\text{VBF}}(\vec{x}) + \sqrt{\mu_{\text{VBF}} \times \frac{\Gamma_H}{\Gamma_0}} \times \mathcal{P}_{\text{int}}^{\text{VBF}}(\vec{x}) + \mathcal{P}_{\text{bkg}}^{\text{VBF}}(\vec{x}) \right] \\ + \mathcal{P}_{\text{bkg}}^{q\bar{q}}(\vec{x}) + \dots$$

CONSTRAINTS FROM THE LOW MASS

# Constraints from the low mass

- Employ a 3D fit and 2 jet tagging categories

$m_{4\ell}$  – invariant mass

$\mathcal{D}_{\text{bkg}}^{\text{kin}}$  – MELO (matrix element likelihood) to suppress background

if at least 2 jets:  $\mathcal{D}_{\text{jet}}$  – to identify VBF or VH ( $m_{jj}, \eta_{jj}$ )

if <2 jets:  $p_T(4\ell)$  – to identify VBF or VH

# Constraints from the low mass

- Employ a 3D fit and 2 jet tagging categories

$m_{4\ell}$  – invariant mass

$\mathcal{D}_{\text{bkg}}^{\text{kin}}$  – MELO (matrix element likelihood) to suppress background

if at least 2 jets:  $\mathcal{D}_{\text{jet}}$  – to identify VBF or VH ( $m_{jj}, \eta_{jj}$ )

if  $< 2$  jets:  $p_T(4\ell)$  – to identify VBF or VH

# Production Mechanism Results

$$\mathcal{P}_{\text{tot}}^{\text{onshell}}(\vec{x}) = \mu_{ggH} \times [\mathcal{P}_{\text{sig}}^{gg}(\vec{x}) + \mathcal{P}_{\text{sig}}^{t\bar{t}H}(\vec{x})] + \mu_{\text{VBF}} \times [\mathcal{P}_{\text{sig}}^{\text{VBF}}(\vec{x}) + \mathcal{P}_{\text{sig}}^{\text{VH}}(\vec{x})] \\ + \mathcal{P}_{\text{bkg}}^{q\bar{q}}(\vec{x}) + \mathcal{P}_{\text{bkg}}^{gg}(\vec{x}) + \dots$$

$$\mu_{ggH} = 0.80^{+0.46}_{-0.36}$$

$$\sigma_{\text{SM}}(ggH + t\bar{t}H) = 14.99 \text{ pb} + 0.085 \text{ pb}$$

$$\mu_{\text{VBF}} = 1.7^{+2.2}_{-2.1}$$

$$\sigma_{\text{SM}}(\text{VBF} + VH) = 1.214 \text{ pb} + 0.896 \text{ pb}$$

$$\mu = \sigma/\sigma_{\text{SM}} = 0.93^{+0.26+0.13}_{-0.23-0.09}$$

CONSTRAINTS FROM THE HIGH MASS

# High Mass: $H \rightarrow ZZ \rightarrow 4\ell$

$$\mathcal{P}_{\text{tot}}^{\text{offshell}}(\vec{x}) = \left[ \mu_{ggH} \times \frac{\Gamma_H}{\Gamma_0} \times \mathcal{P}_{\text{sig}}^{gg}(\vec{x}) + \sqrt{\mu_{ggH} \times \frac{\Gamma_H}{\Gamma_0} \times \mathcal{P}_{\text{int}}^{gg}(\vec{x}) + \mathcal{P}_{\text{bkg}}^{gg}(\vec{x})} \right] + \left[ \mu_{\text{VBF}} \times \frac{\Gamma_H}{\Gamma_0} \times \mathcal{P}_{\text{sig}}^{\text{VBF}}(\vec{x}) + \sqrt{\mu_{\text{VBF}} \times \frac{\Gamma_H}{\Gamma_0} \times \mathcal{P}_{\text{int}}^{\text{VBF}}(\vec{x}) + \mathcal{P}_{\text{bkg}}^{\text{VBF}}(\vec{x})} \right]$$

$$\Gamma_H = 1.9_{-1.9}^{+11.7} \text{ MeV} < 33 \text{ MeV at 95\% CL}$$

$$\text{expected: } 4.2_{-4.2}^{+17.3} \text{ MeV} < 42 \text{ MeV at 95\% CL}$$

# 1D Fit in $H \rightarrow ZZ \rightarrow 4\ell$

# High Mass: $H \rightarrow ZZ \rightarrow 2\ell 2\nu$

- Combine  $H \rightarrow ZZ \rightarrow 2\ell 2\nu$  at high mass and  $4\ell$  at low mass

$$\Gamma_H = 1.8_{-1.8}^{+12.4} \text{ MeV} < 33 \text{ MeV at 95\% CL}$$

$$\text{expected: } 4.2_{-4.2}^{+19.3} \text{ MeV} < 44 \text{ MeV at 95\% CL}$$

# Combined Result

$$\Gamma_H = 1.8_{-1.8}^{+7.7} \text{ MeV} < 22 \text{ MeV} = 5.4 \times \Gamma_H^{\text{SM}} \text{ at 95\% CL}$$

$$\text{expected: } 4.2_{-4.2}^{+13.5} \text{ MeV} < 33 \text{ MeV} = 8 \times \Gamma_H^{\text{SM}} \text{ at 95\% CL}$$

# Model (in)dependence

---

$$\sigma_{gg \rightarrow H \rightarrow ZZ}^{\text{onpeak}} = \text{const} \frac{g_{ggH}^2 g_{HZZ}^2}{\Gamma} \quad \sigma_{gg \rightarrow H \rightarrow ZZ}^{\text{offpeak}} = \text{const}' g_{ggH}^2 g_{HZZ}^2$$

- Higgs boson coupling  $HVV$  ( $g_{HVV}$ )
  - experimental limits prefer tree-level SM  $HVV$  coupling
  - anomalous  $HVV$  couplings enhance off-shell production  
⇒ **conservative limit**
- Higgs boson production in gluon fusion ( $g_{ggH}$ )
  - top quark dominance, **no new particles in the loop**
- Higgs boson production mechanism
  - very mild dependence (e.g.  $VH$  vs VBF), **fit directly in the data**
- Background model
  - no BSM in background; benefit from improved SM calculations

# CP Results in $H \rightarrow ZZ \rightarrow 4\ell$

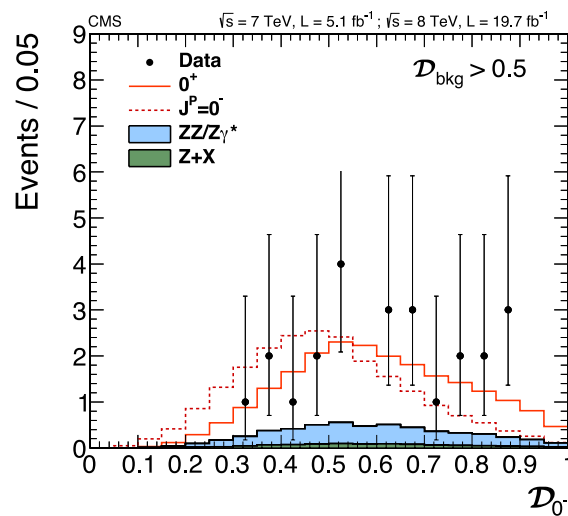

- Assumed **tree-level**  $HVV$  coupling either in decay or VBF production

$$A(HVV) = \frac{1}{v} \left( a_1 m_V^2 \epsilon_1^* \epsilon_2^* + a_2 f_{\mu\nu}^{*(1)} f^{*(2),\mu\nu} + a_3 f_{\mu\nu}^{*(1)} \tilde{f}^{*(2),\mu\nu} \right)$$

SM Higgs  $0^+$ : ( $a_1$ ) CP       $\sim$ few% ( $a_2$ ) CP       $\sim 10^{-10}$  ? ( $a_3$ ) CP

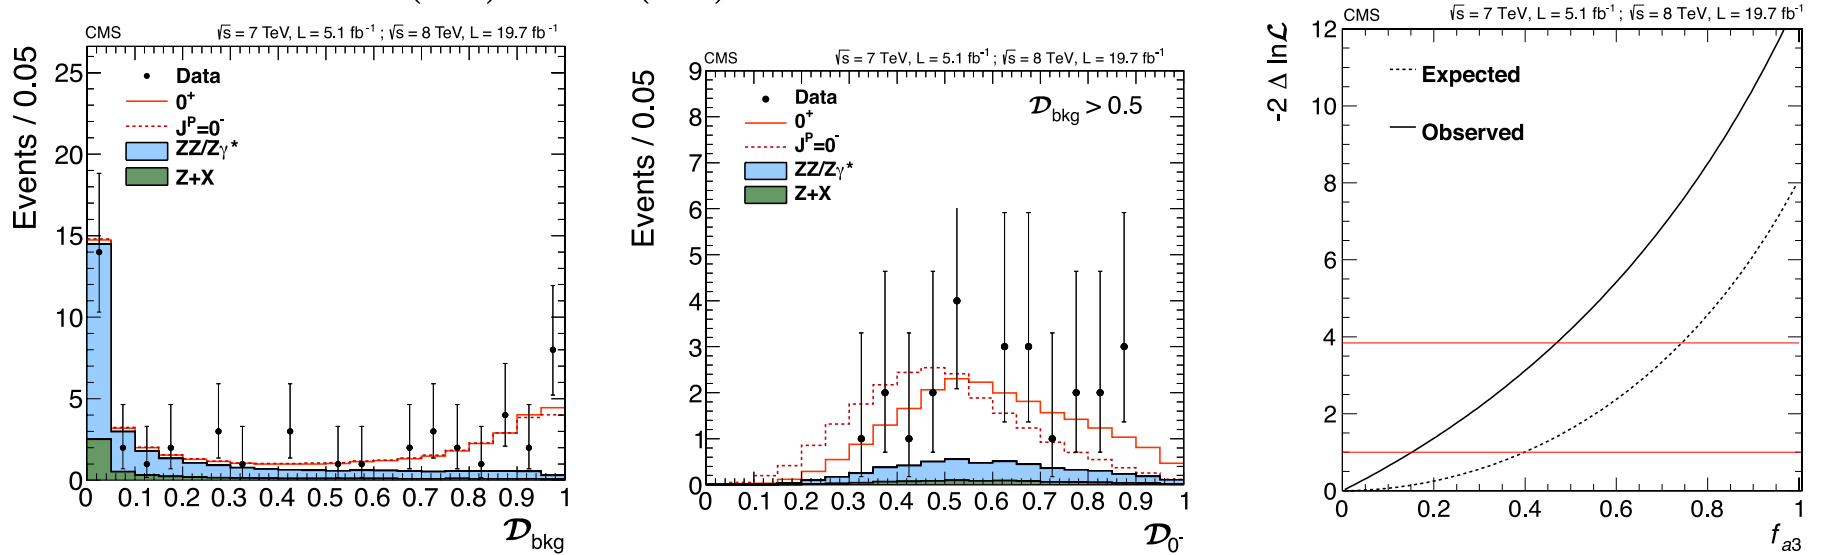

- Test with optimal MELO observables for many  $J^P$  models, e.g.  $0^-$

# CP Results in $H \rightarrow ZZ \rightarrow 4\ell$

- Exclude pure pseudo-scalar  $0^-$  at 99.95% CL

$$f_{a3} = \frac{\sigma(a_3)}{\sigma(a_1) + \sigma(a_3)} = 0.00^{+0.17}_{-0.00} < 0.51 \text{ at } 95\% \text{ CL}$$

- and many other models:  
spin-0, 1, 2  
consistent with  $J^P = 0^+$

# Anomalous $HVV$ Couplings and Off-shell Effects

$$A(HVV) = \frac{1}{v} \left( g_1 m_V^2 \epsilon_1^* \epsilon_2^* + g_2 f_{\mu\nu}^{*(1)} f^{*(2),\mu\nu} + g_4 f_{\mu\nu}^{*(1)} \tilde{f}^{*(2),\mu\nu} \right)$$

- Higher-dimensional non-renormalizable operators lead to

$\sigma_4/\sigma_1$  blowing up at higher  $q^2$  (for pseudoscalar  $0^-$ )

same effect for  $0_h^+$ , spin-2, spin-1; example of  $f\bar{f} \rightarrow V^*(q^2) \rightarrow VH$

# Anomalous $HVV$ Couplings and Off-shell Effects

- Same enhancement  $\sigma_i/\sigma_1$  with higher-dim. operators  $H^*(q^2 = m_{ZZ}^2)$

similar study also in arXiv:1403.4951 [hep-ph]

- Conclusion on anomalous  $HVV$  couplings:
  - experimental data consistent with SM coupling  $a_1$
  - there is still room for **small anomalous contributions**
  - width constraint would be only **tighter** if those are present

# Anomalous $ggH$ Couplings

- In  $gg \rightarrow H$  rely on the dominance of  $t$ -quark in the loop
  - assume **no new particles** in the loop
  - otherwise some modification to offshell / onshell ratio

WHAT IS THE HIGGS BOSON LIFETIME

# Higgs Boson Lifetime

- How long does the Higgs boson live?

$$\tau_H = \frac{\hbar}{\Gamma_H}, \quad \text{expect } 1.6 \times 10^{-22} \text{ s}$$

we know it is **not stable** ( $H \rightarrow ZZ, \dots$ )

observe  $0.3 \times 10^{-22} \text{ s} < \tau_H < \infty$

- Can we set a better upper bound?

– expect  $\sigma_v \sim 50 \mu\text{m}$  vertex resolution,  $p \sim 50 \text{ GeV}$

– flight distance  $\sim \frac{p}{mc} c\tau_H \sim 2 \cdot 10^{-14} \text{ m} = 20 \text{ fm} \sim 4 \times 10^{-10} \times \sigma_v$

could reach  $0.3 \times 10^{-22} \text{ s} < \tau_H < (?) 0.4 \times 10^{-12} \text{ s} < \infty$

# Summary: How Wide is the Higgs Boson?

$$0 < \Gamma_H < 22 \text{ MeV} = 5.4 \times \Gamma_H^{\text{SM}} \text{ at 95\% CL}$$

$$(0.3 \times 10^{-22} \text{ s} < \tau_H < \infty)$$

mild assumptions (no new particles in  $ggH$  loop)

- Rich physics with the Higgs boson
  - mass
  - width and lifetime
  - quantum numbers /  $CP$
  - production and decay couplings
- So far consistent picture  
reduced room to decay to new states...
