Feb. 14, 2023

Launching (relatively) soon!

Medium-class explorer (MIDEX)

PI: **Jamie Bock** (Caltech/JPL)

Selected in 2019

Targeting **launch in 2025**

Thomas Zurbuchen ✓
@Dr_ThomasZ

This afternoon while at @NASAJPL, I notified Jamie Bock, @Caltech professor and the future SPHEREx mission Principal Investigator, that his proposal will become a NASA mission. I'm happy I could tell him this exciting news in person. Watch:

The image shows a tweet from Thomas Zurbuchen (@Dr_ThomasZ) with a video player. The video shows two men in an office setting. The man on the left is wearing a blue button-down shirt and the man on the right is wearing a grey suit jacket. They are sitting at a desk with a bookshelf in the background containing various models and books. The video player shows a play button, view count (4,387 views), and a progress bar (2:07 / 3:38). The tweet text says: "This afternoon while at @NASAJPL, I notified Jamie Bock, @Caltech professor and the future SPHEREx mission Principal Investigator, that his proposal will become a NASA mission. I'm happy I could tell him this exciting news in person. Watch: Mission info: go.nasa.gov/2Eawfil". The tweet is dated 2:01 PM · Feb 13, 2019.

The SPHEREx collaboration

Ari

What is SPHEREx?

Low-Earth orbit

Near infrared (0.5-5 μm)

Full sky

Mid-resolution

- Spatial: 6''
- Spectral: $R = 40-100$

Why space?

“The 1997 reference of diffuse night sky brightness”
Leinert+ 1998

Why SPHEREx?

How did the Universe begin?

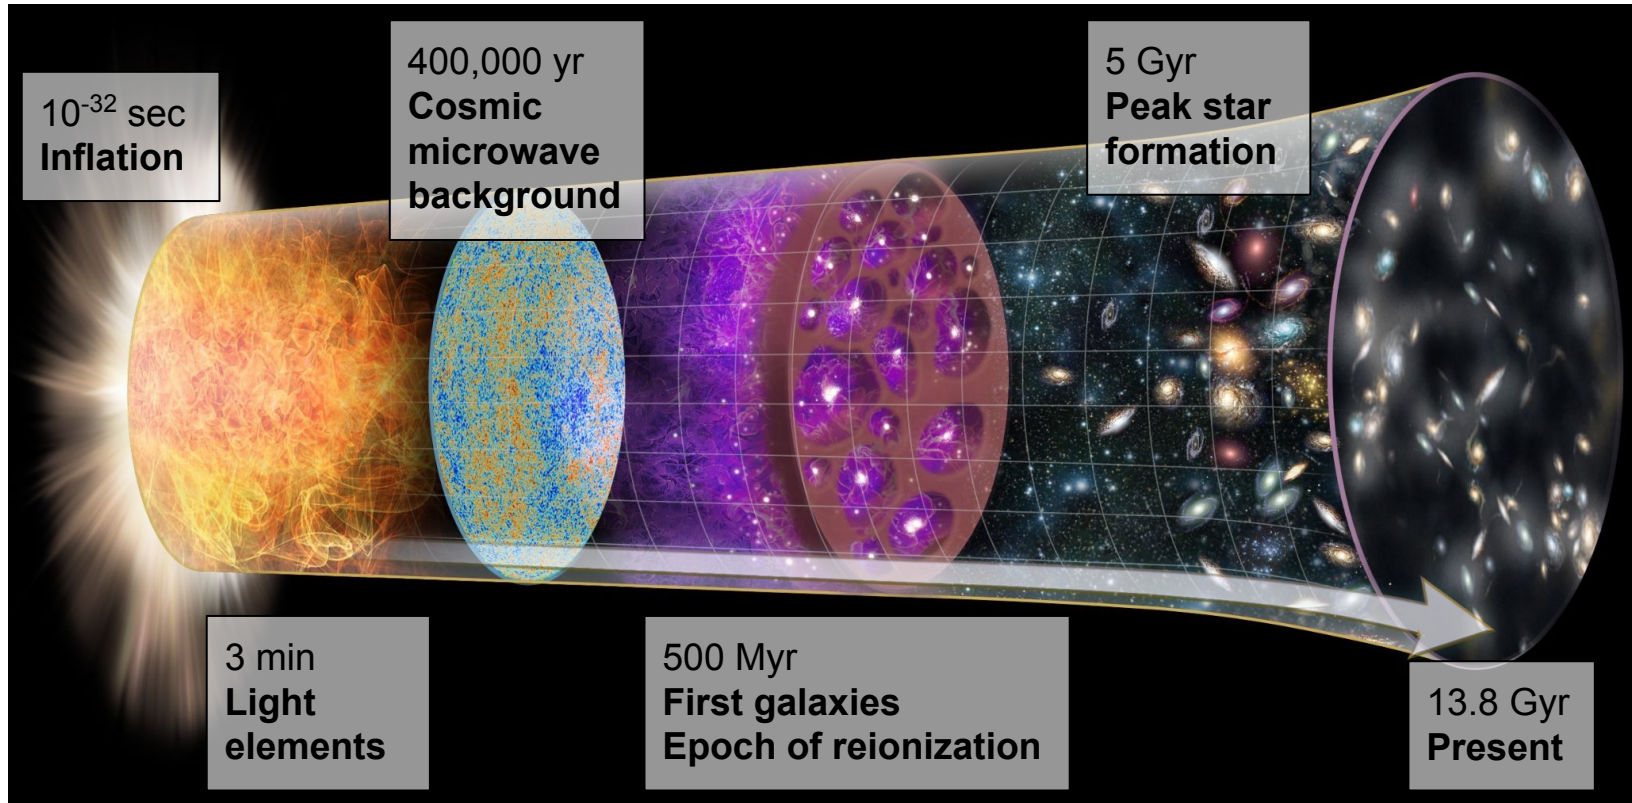

How did galaxies form?

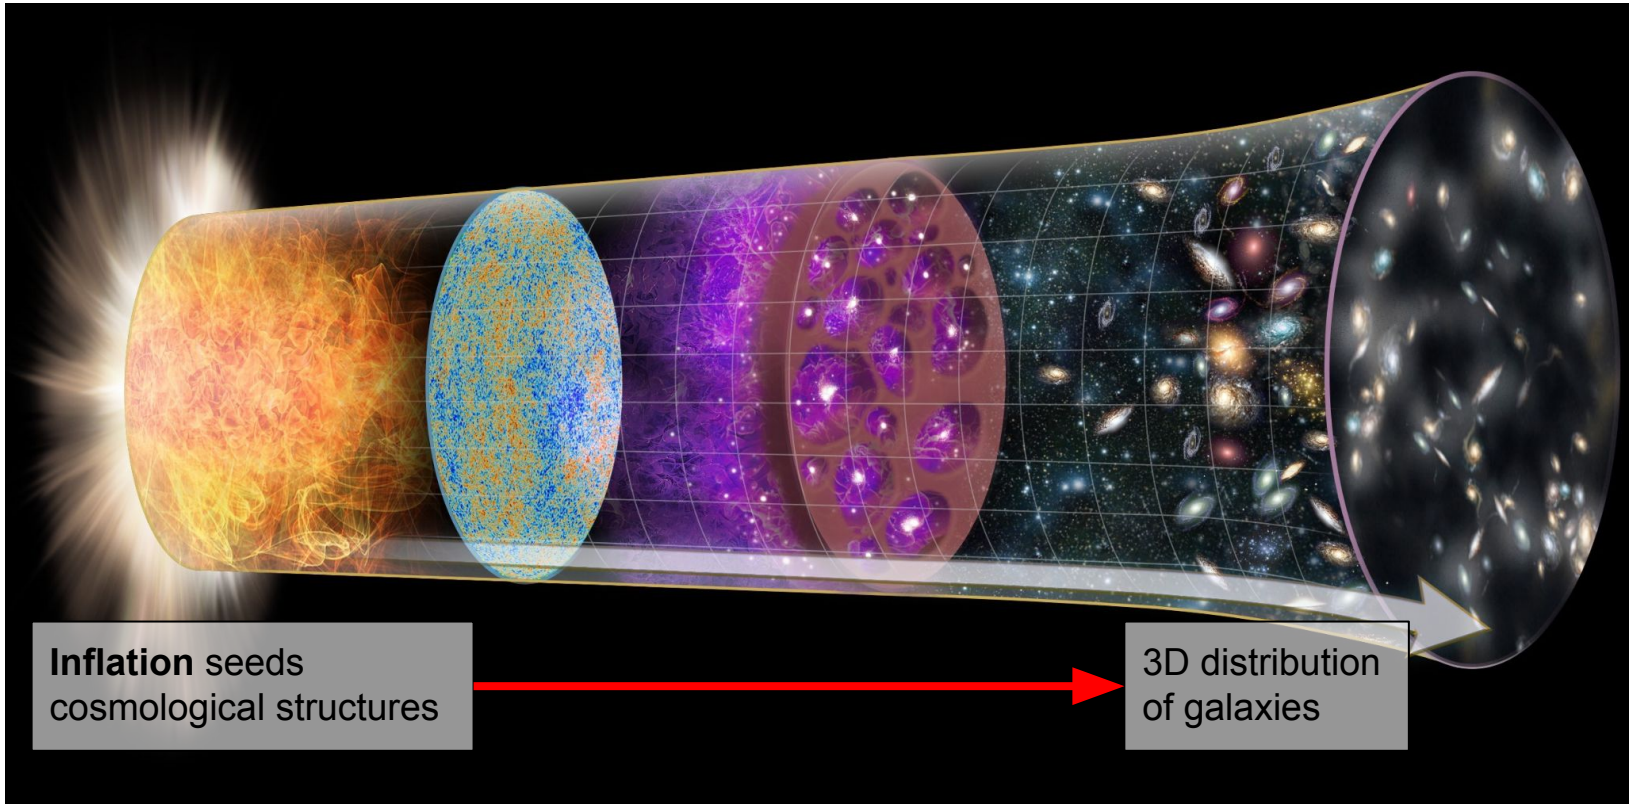

How did life form?

A brief history of the Universe

How did the Universe begin?

Inflation seeds
cosmological structures

3D distribution
of galaxies

Cosmic inflation

Leading paradigm

- Quantum fluctuations seed structure

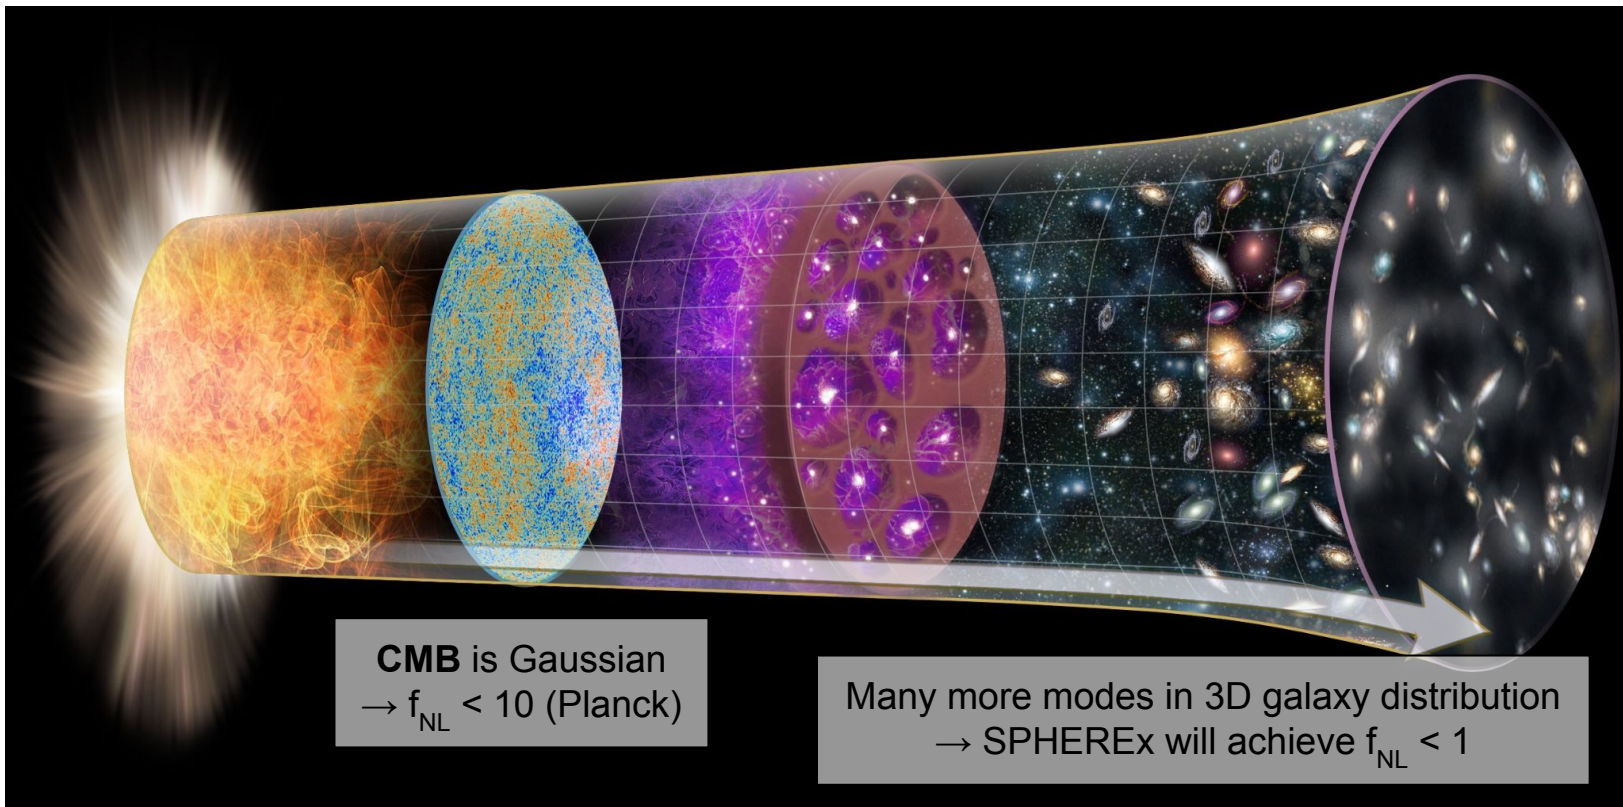

Constrained through CMB polarization

Orthogonal constraints with 3D galaxy distribution → SPHEREx

Non-gaussianity

CMB is Gaussian
→ $f_{\text{NL}} < 10$ (Planck)

Many more modes in 3D galaxy distribution
→ SPHEREx will achieve $f_{\text{NL}} < 1$

Non-gaussianity

Non-gaussianity

How did galaxies form?

Extragalactic background light (EBL)

Census of cosmic light production

Intensity mapping

Integrated light from all sources
including unresolved

- Dwarf galaxies
- Stripped stars (intrahalo light)
- High-redshift galaxies

A report of the detection of microwave radiation from water molecules in space, by the group which recently detected interstellar ammonia emission.

MICROWAVE emission from the $6_{16} \rightarrow 5_{23}$ rotational transition of H_2O has been observed from the directions of Sgr B2, the Orion Nebula and the W49 source. This radiation, at 1.35 cm wavelength, was detected with the twenty foot radio telescope at the Hat Creek Observatory using techniques described earlier for the detection of the NH_3 spectrum¹. In the case of Sgr B2, the H_2O emission is from the same direction in which considerable NH_3 is observed (unpublished work of A. C. C. *et al.*), although there is reason to believe the two molecular species may not be closely associated. Strong H_2O radiation producing an antenna temperature of 14° K is observed from the Orion Nebula (where no NH_3 was detected), and an antenna temperature at least as high as 55° was found for H_2O radiation from W49.

velocity found for one of the OH emission and broad OH absorption features observed in this region², the 62 km s⁻¹ Doppler velocity of a small nearby HII region³, and the velocity of about 58 km s⁻¹ found for NH_3 (unpublished work of A. C. C. *et al.*) observed in this direction. The results shown in Fig. 1 were obtained with filters producing a spectral resolution of about 1.3 MHz.

Fig. 2 shows the antenna temperature as a function of Doppler velocities observed in the Orion Nebula at $\alpha_{1950} = 5 \text{ h } 32 \text{ m } 57 \text{ s } \pm 4 \text{ s}$ and $\delta_{1950} = -5^\circ 25.5' \pm 1.0'$. In Orion, the radiation intensity was sufficiently high to make practical the use of filters producing a spectral resolution of about 350 kHz. In Fig. 2 the solid line represents the continuum temperature as it was measured with filters of width 2 MHz; the plotted points represent

Interstellar ices

99% of interstellar water is **ice**

“Follow the water” → “Follow the ice”

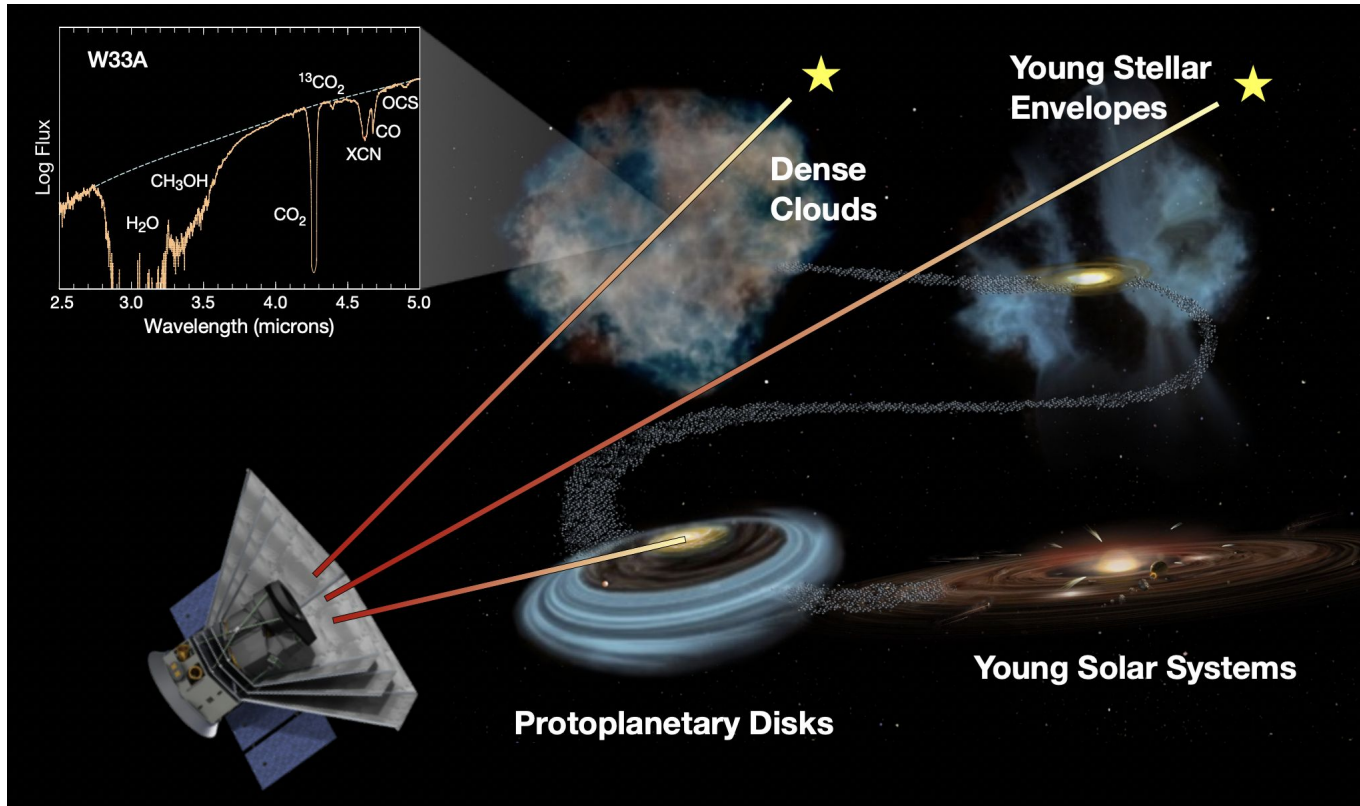

Water isn't the only biogenic molecule

“Follow the ice” → “Follow the **ices**”

Ice absorption
