

Pass0 Analysis: SVT Hits and Timing II

Norman Graf (SLAC)

Reconstruction / Analysis Meeting

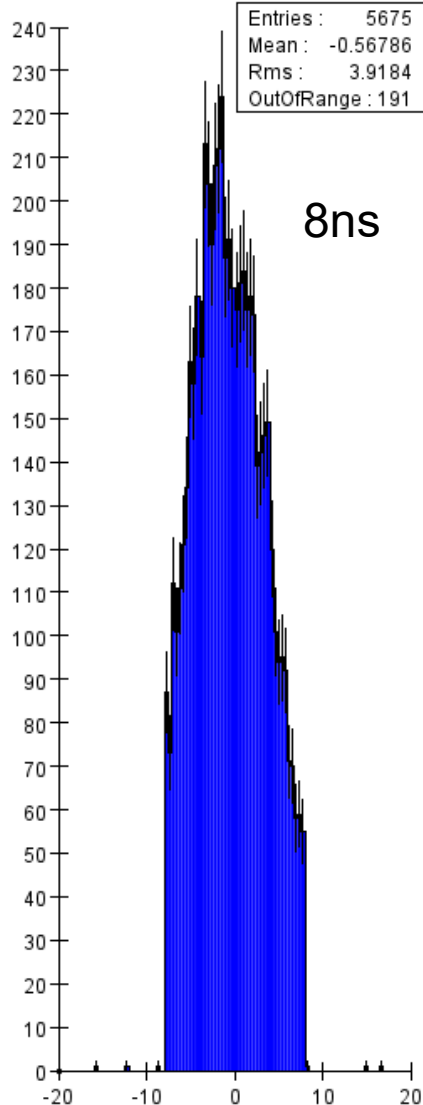

March 28, 2023

SVT Hits and Timing Data

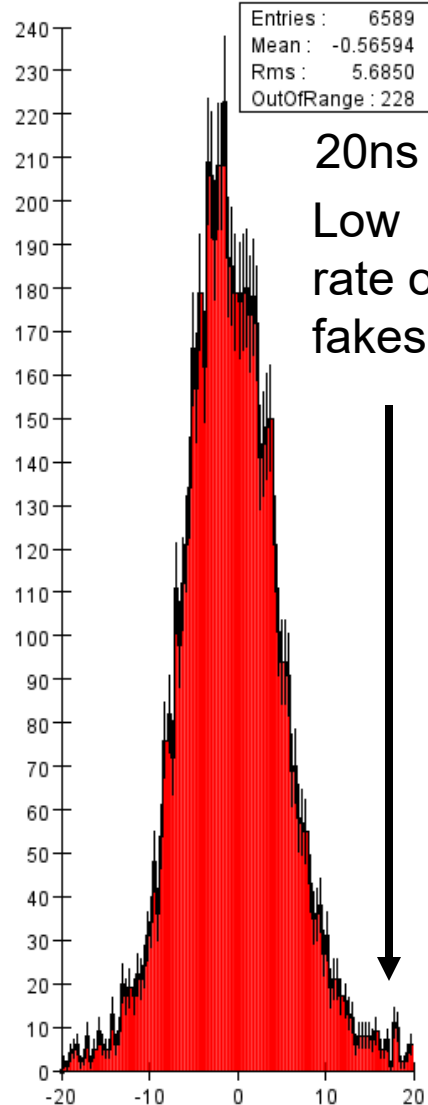

- Previous talk demonstrated that the 8ns timing cut in the strip-clustering was too aggressive
- Reconstruct some 2019 data using default value of 8ns and also with a looser cut of 20ns
 - batch farm was experiencing hardware issues, so only reconstructed one set of skims, 10104 bottom FEE
- Compare output

Track & Cluster Times 8ns

Track & Cluster Times 20ns

Energy, Momentum, E/p 8ns

Energy, Momentum, E/p 20ns

Track Momentum δ ns

Track Momentum 20ns

E/p 8/20 ns

FinalStateParticles_KF - fiducial - kf electron - EoverP bottom

Improvement in E/p
with more 2-strip hits

Summary

- Opening up the time window for strip clustering from 8ns to 20s does not appear to introduce any appreciable background
 - delta-time distribution ~baseline resolved
- Promotion of single-strip clusters to two-strip clusters leads to an improvement in the track momentum reconstruction.
- 20ns should be the default for further processing unless we can achieve significant improvements in the time resolution from fitting the APV25 waveforms.
