

New Detector Qualification: 2019

Norman Graf (SLAC)
HPS Analysis Workshop
April 12, 2023

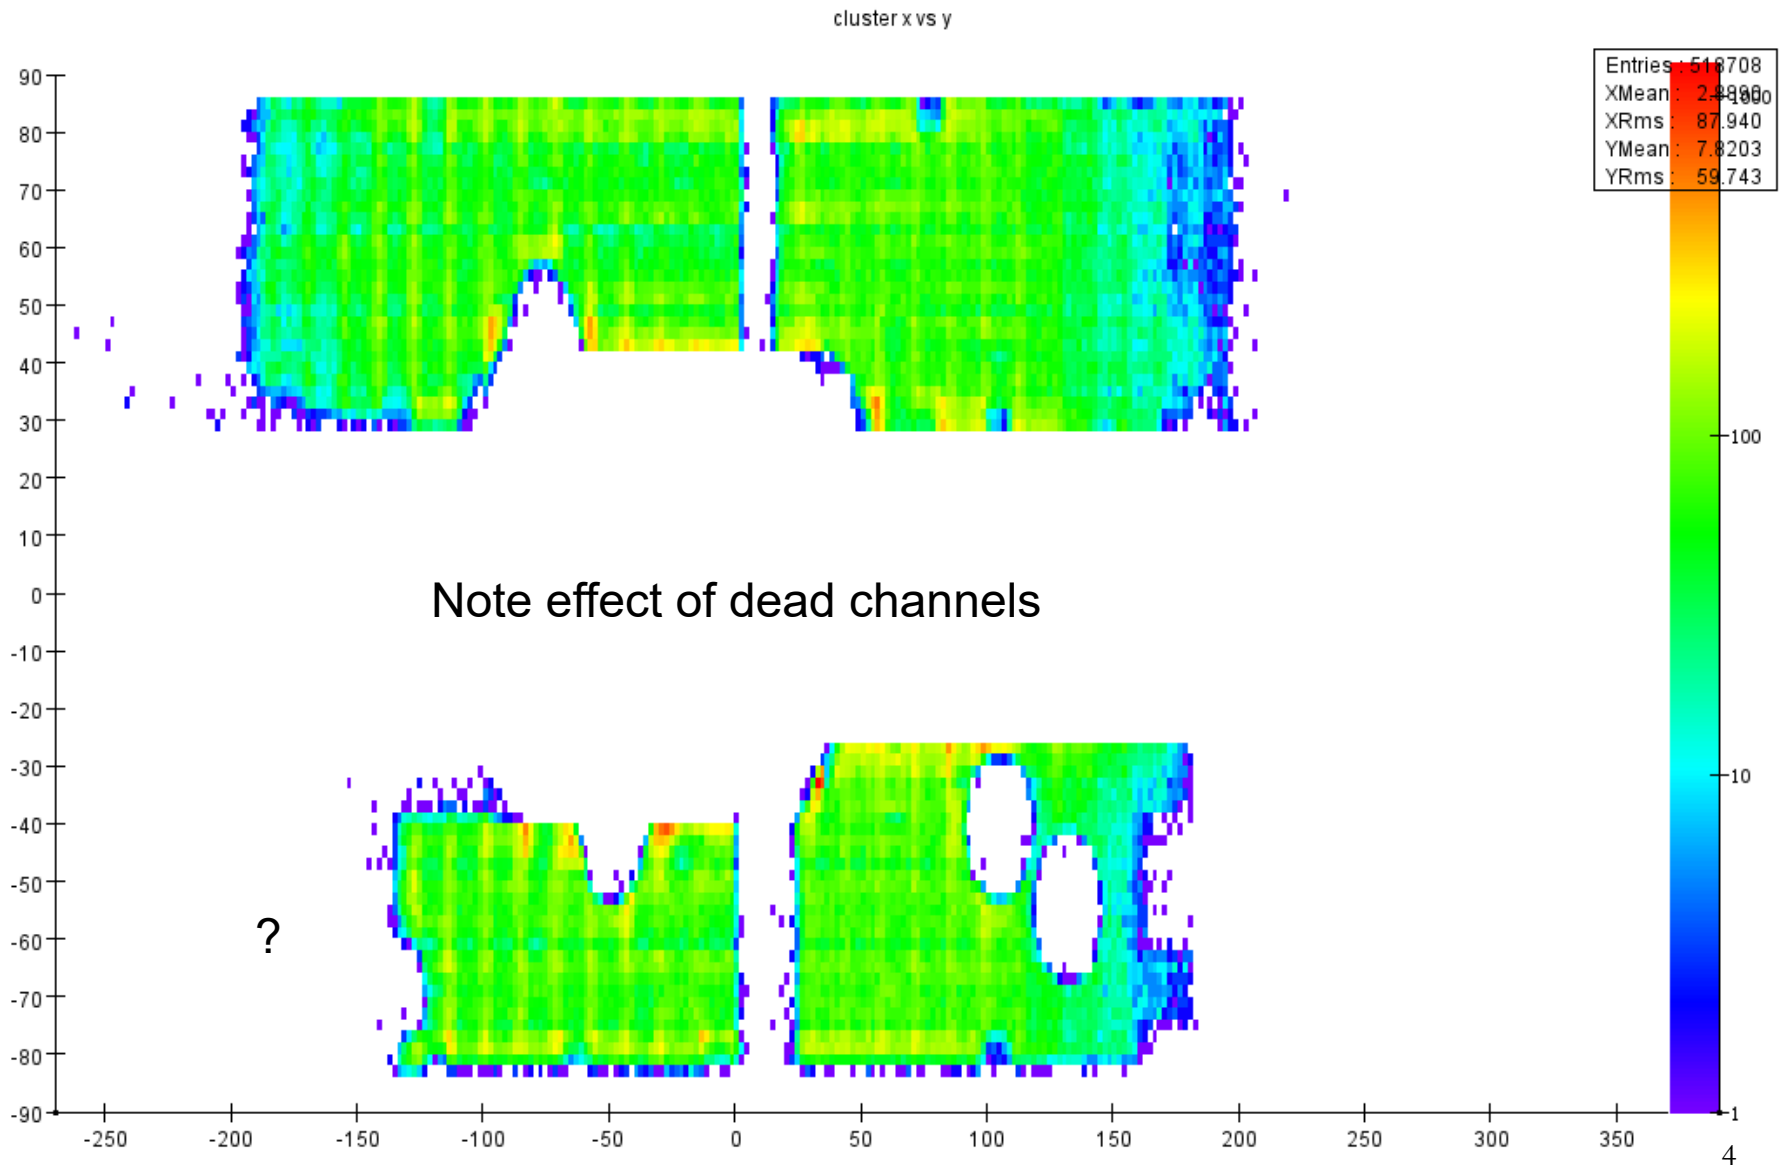

Characterizing A New Detector

- Characterize the detector performance for a new iteration of the 2019 detector
 - HPS_TimDesign_iter6
- Use dedicated FEE runs 10103, 10104

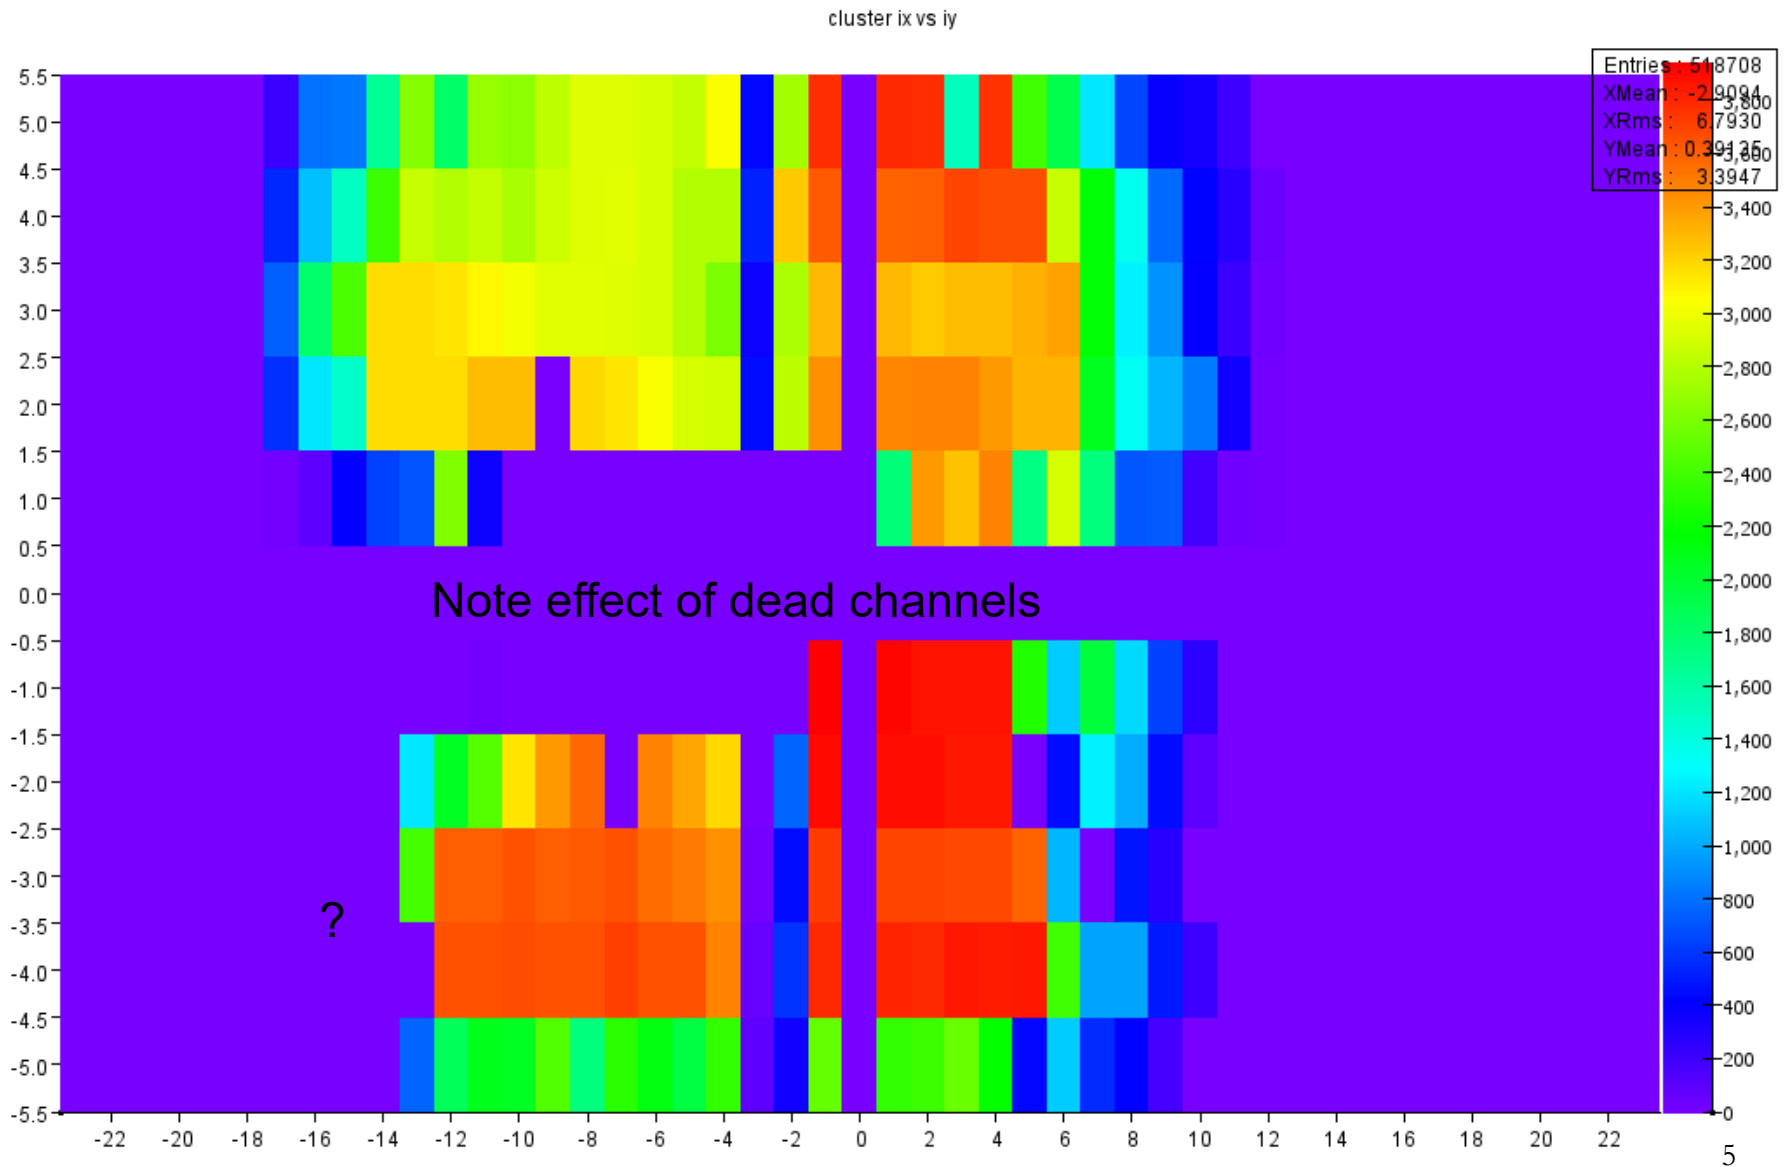

FEE Analysis

- Reconstruct FEE runs 10103 using
 - HPS_TimDesign_iter6
 - Correct z of Ecal face for track propagation
 - iss963 work in progress on Ecal cluster position improvements
- Skim FEE candidates to ~evenly populate as much of the Ecal as possible
 - 1 and only 1 Ecal cluster
 - negative-sign track associated with cluster
 - cluster energy > 4.3 GeV
 - maximize #hits on track
 - top hole & slot 12 hits
 - bottom hole 14 hits
 - bottom slot 12 or 13 (missing sensor and APV25 on another)
 - all hits on track on either slot or hole, no overlap
 - limit number of clusters per crystal channel to $<4k$

FEE Cluster (x,y) Positions

FEE Cluster Channel (ix,iy) Occupancy

FEE Cluster Energy Track Momentum

cluster energy top

cluster energy bottom

track momentum top

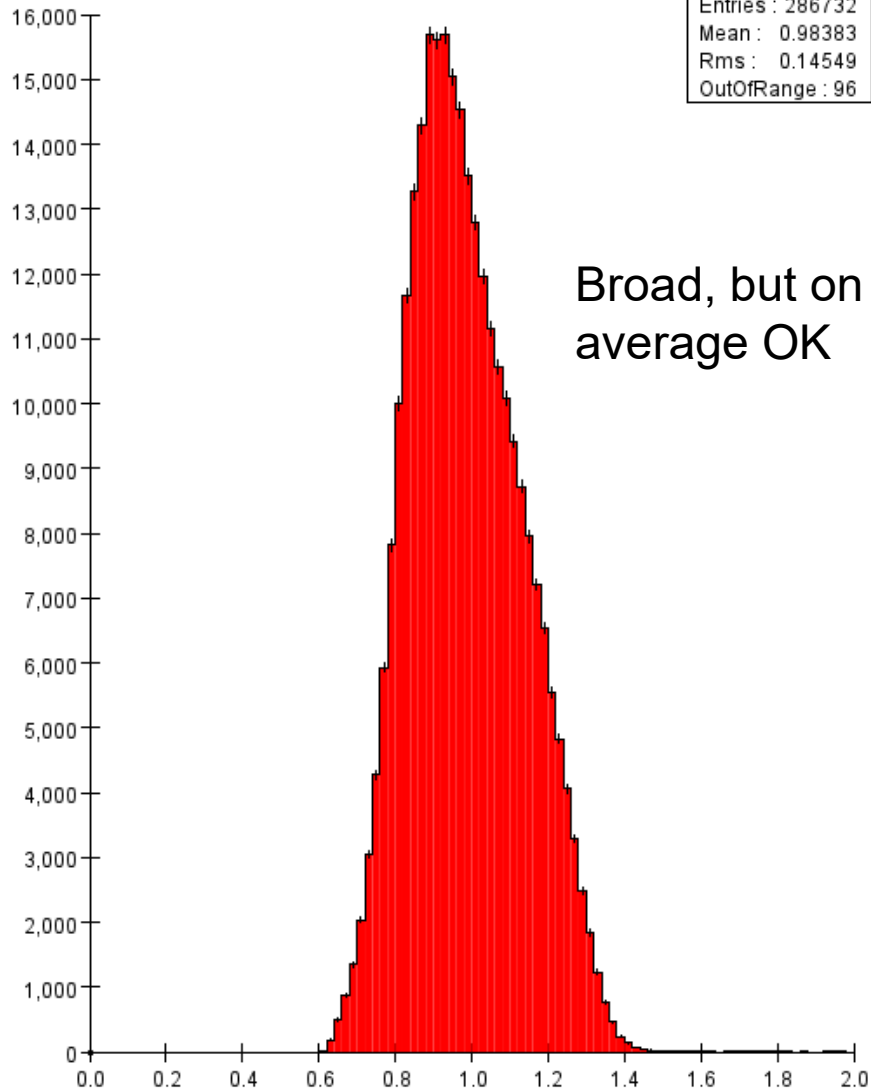

track momentum bottom

Track E/p

EoverP top

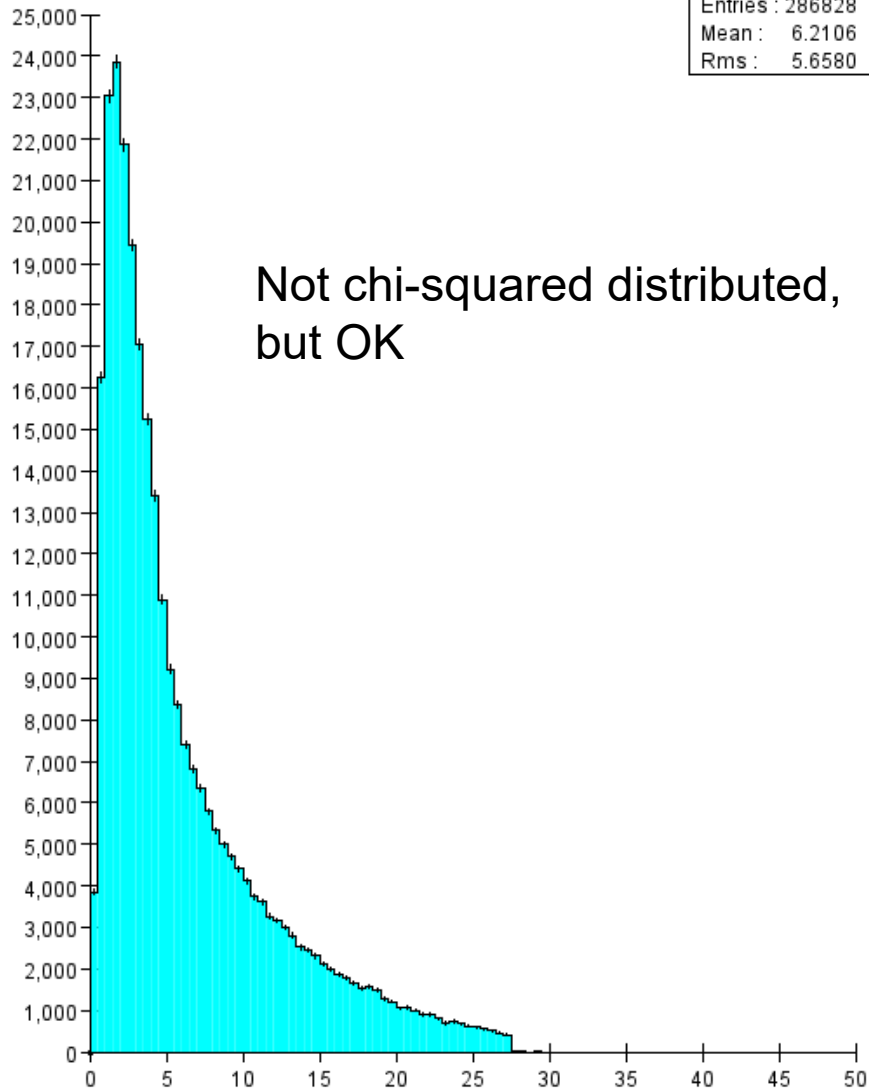

EoverP bottom

Track Chi-Squared

track chisquared per dof top

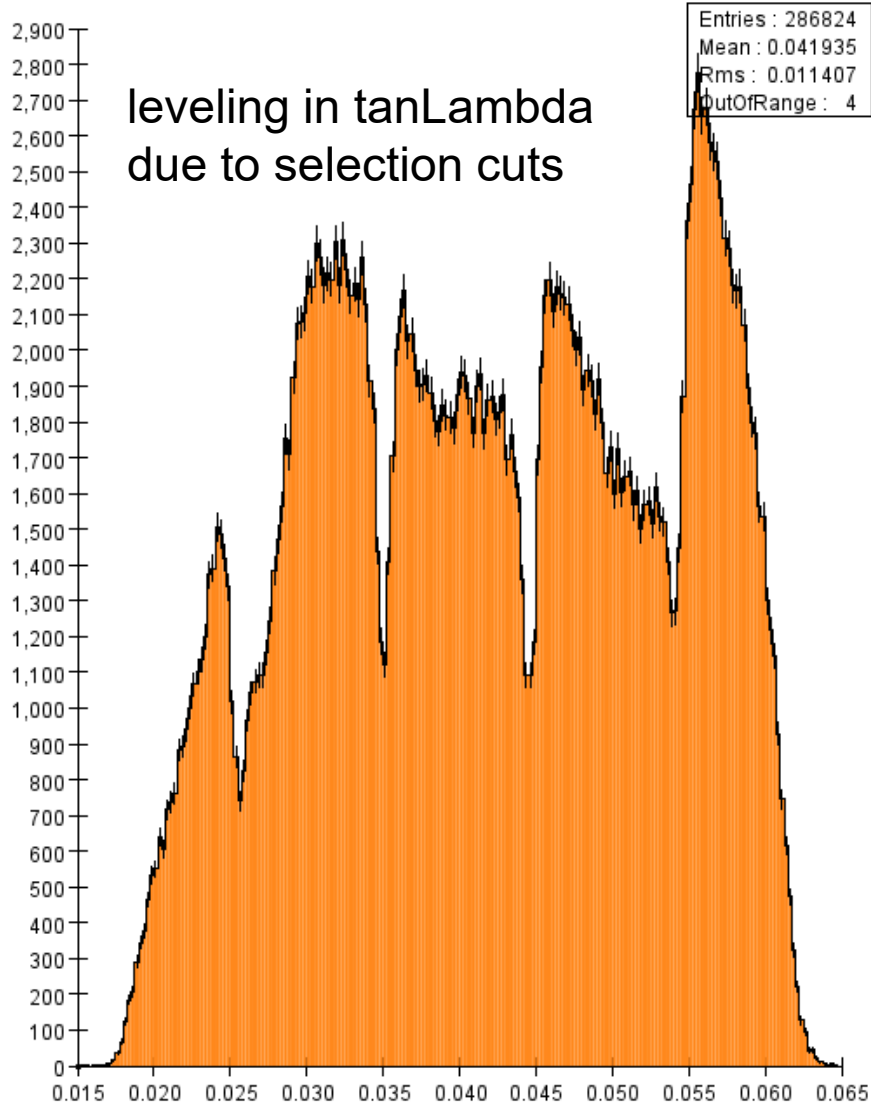

track chisquared per dof bottom

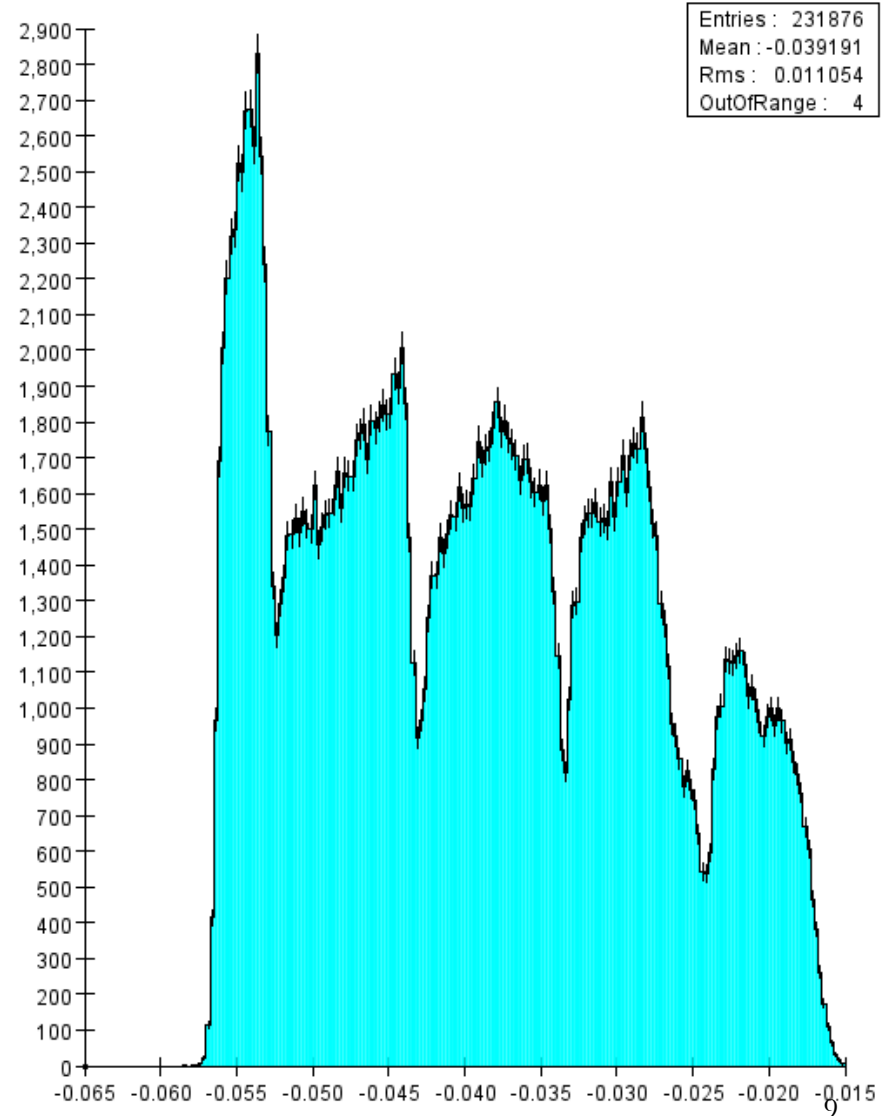

Track TanLambda (ThetaY)

track tanLambda top

track tanLambda bottom

Track tanLambda vs Momentum

Bottom 14 hits (hole)

tanLambda vs p bottom 14 hits

Track $\tan\Lambda$ vs Momentum

Top 12 hits (hole and slot)

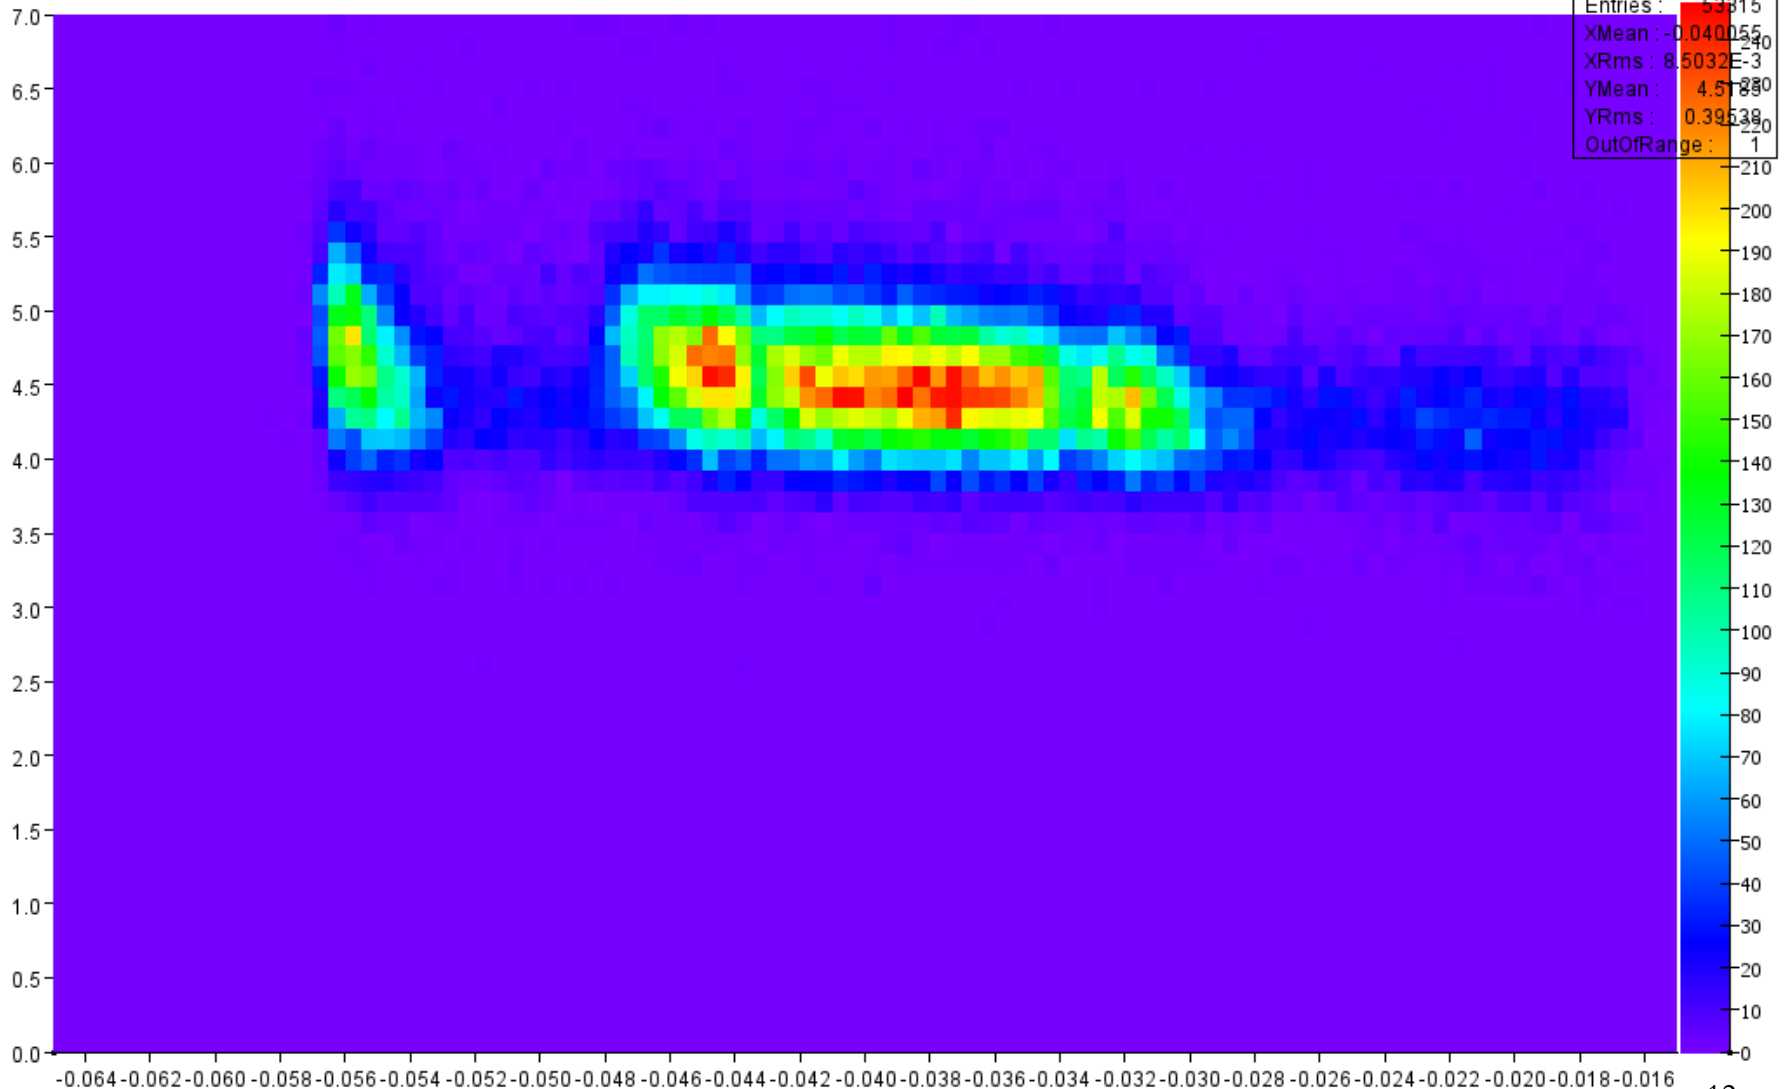

$\tan\Lambda$ vs p top 12 hits

Track tanLambda vs Momentum

Bottom 12 hits (hole and slot)

tanLambda vs p bottom 12 hits

Track $\tan\Lambda$ vs Z_0

Bottom 12 hits (hole and slot)

IP Position (multi-event vertex)

aida8007540138017389931.aida - 2019 4.55Gev - HPS_TimDesign_iter6 - MultiEventVtx

aida8007540138017389931.aida - 2019 4.55Gev - HPS_TimDesign_iter6 - MultiEventVtx

Good agreement in all coordinates

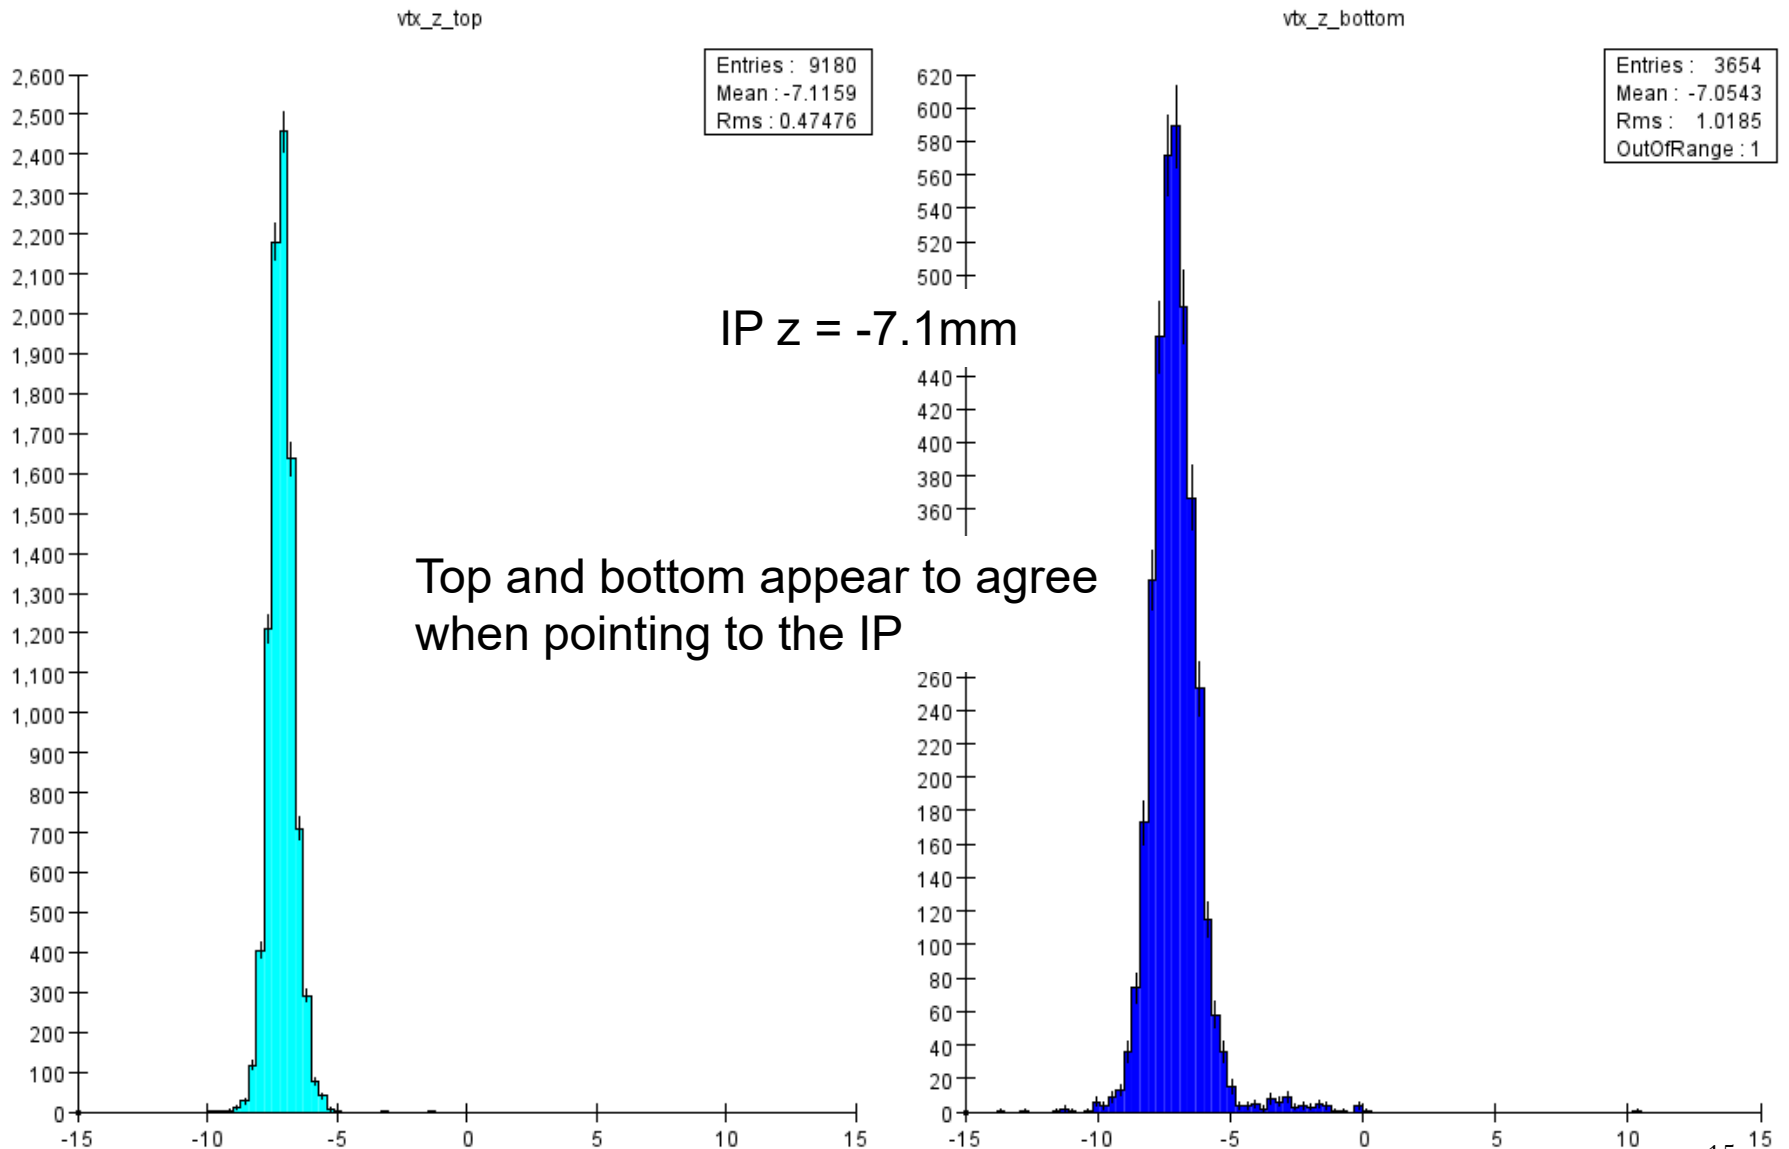

aida8007540138017389931.aida - 2019 4.55Gev - HPS_TimDesign_iter6 - MultiEventVtx

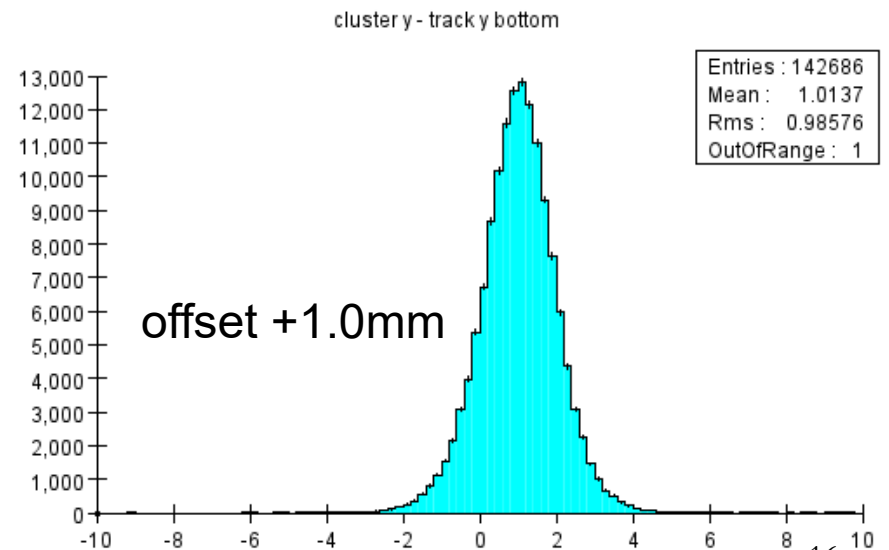

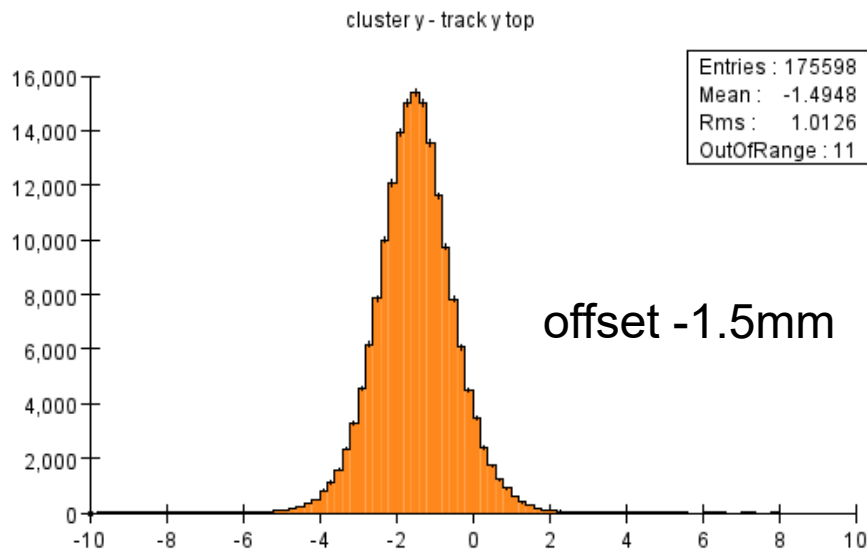

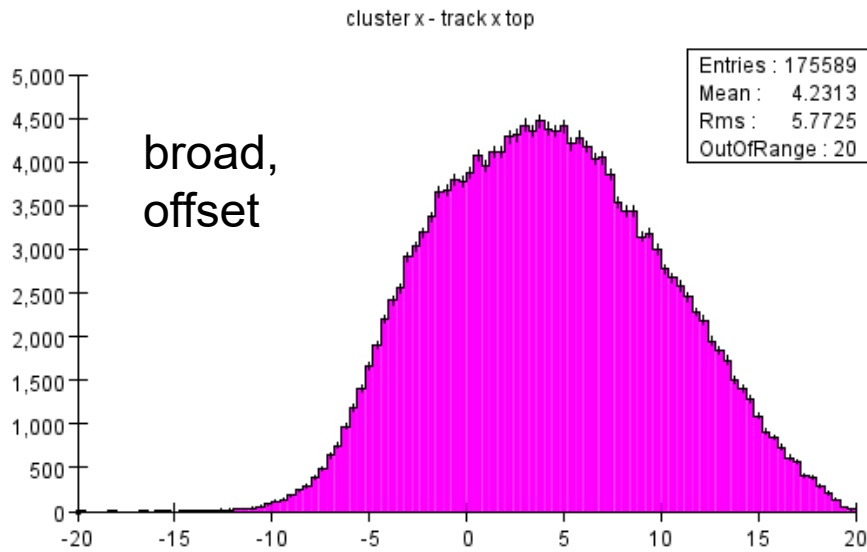

aida8007540138017389931.aida - 2019 4.55Gev - HPS_TimDesign_iter6 - MultiEventVtx

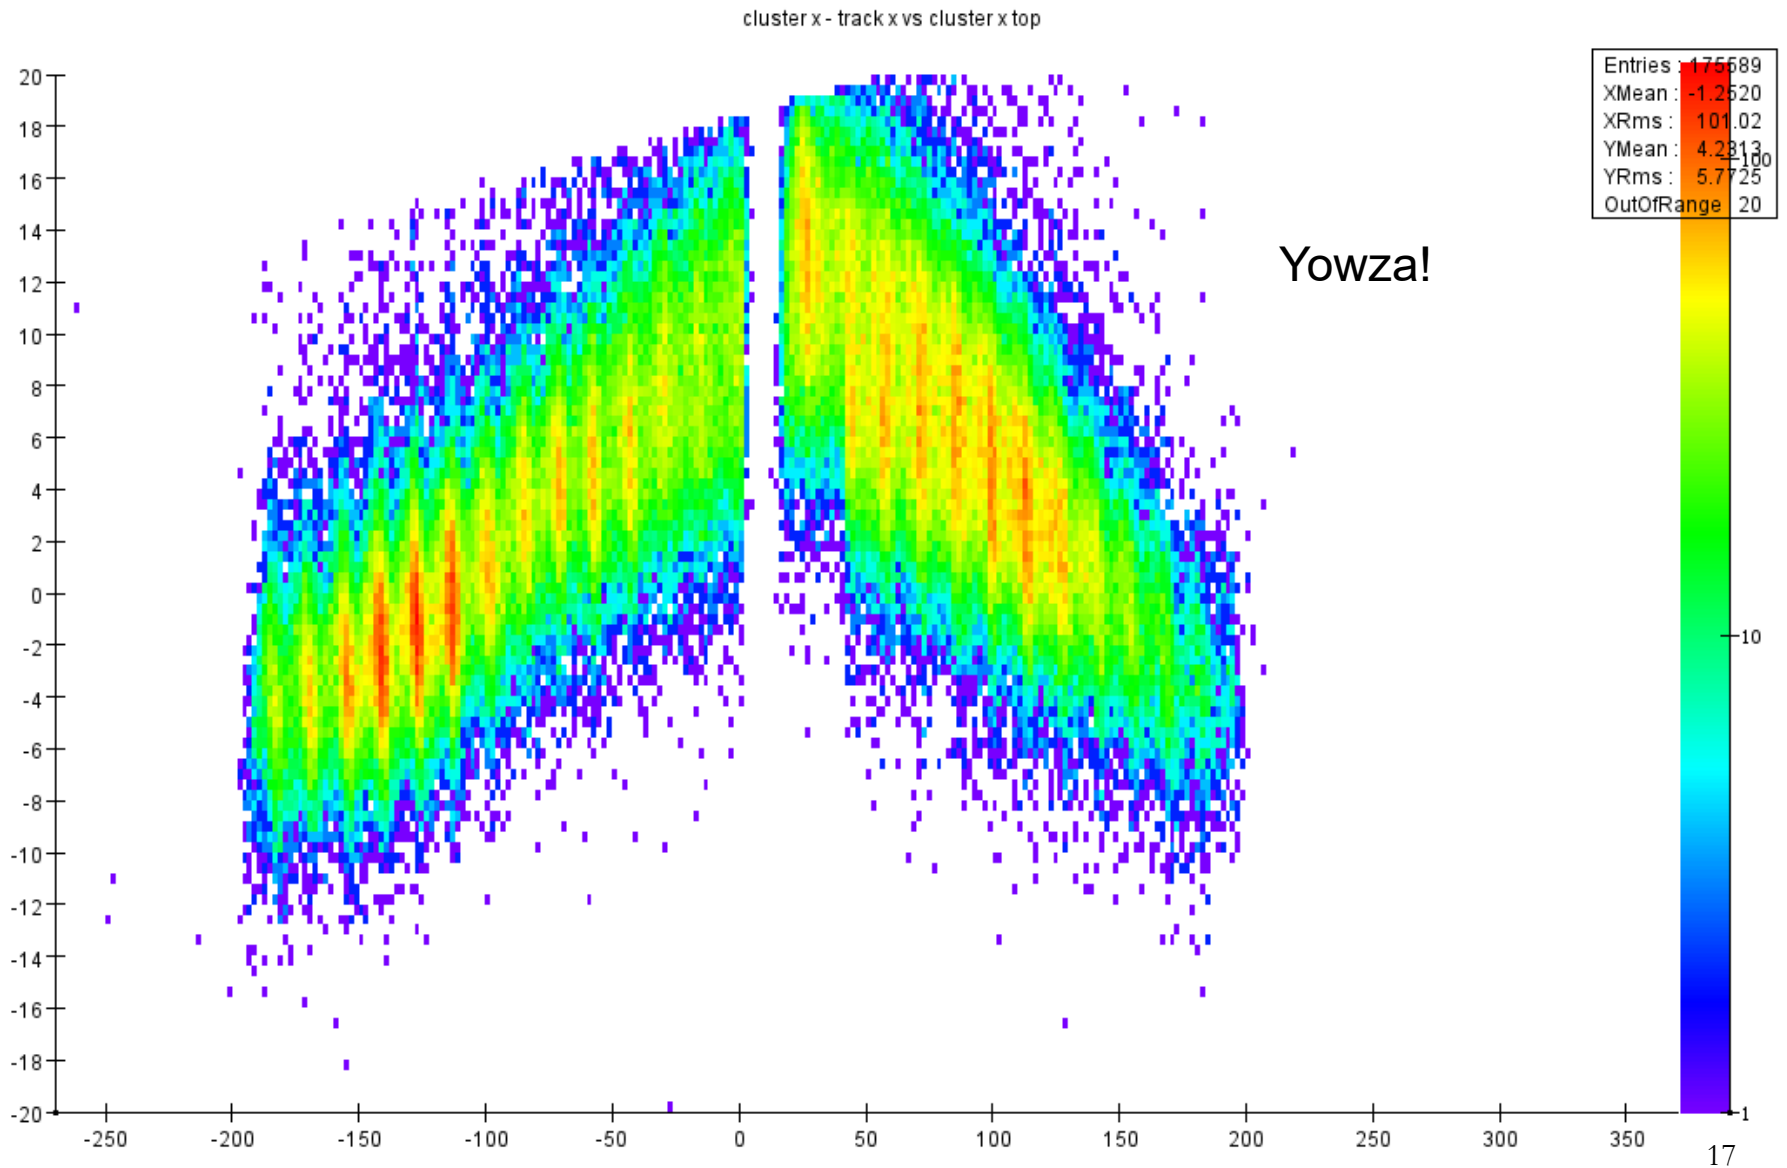

IP Z Position (multi-event vertex)

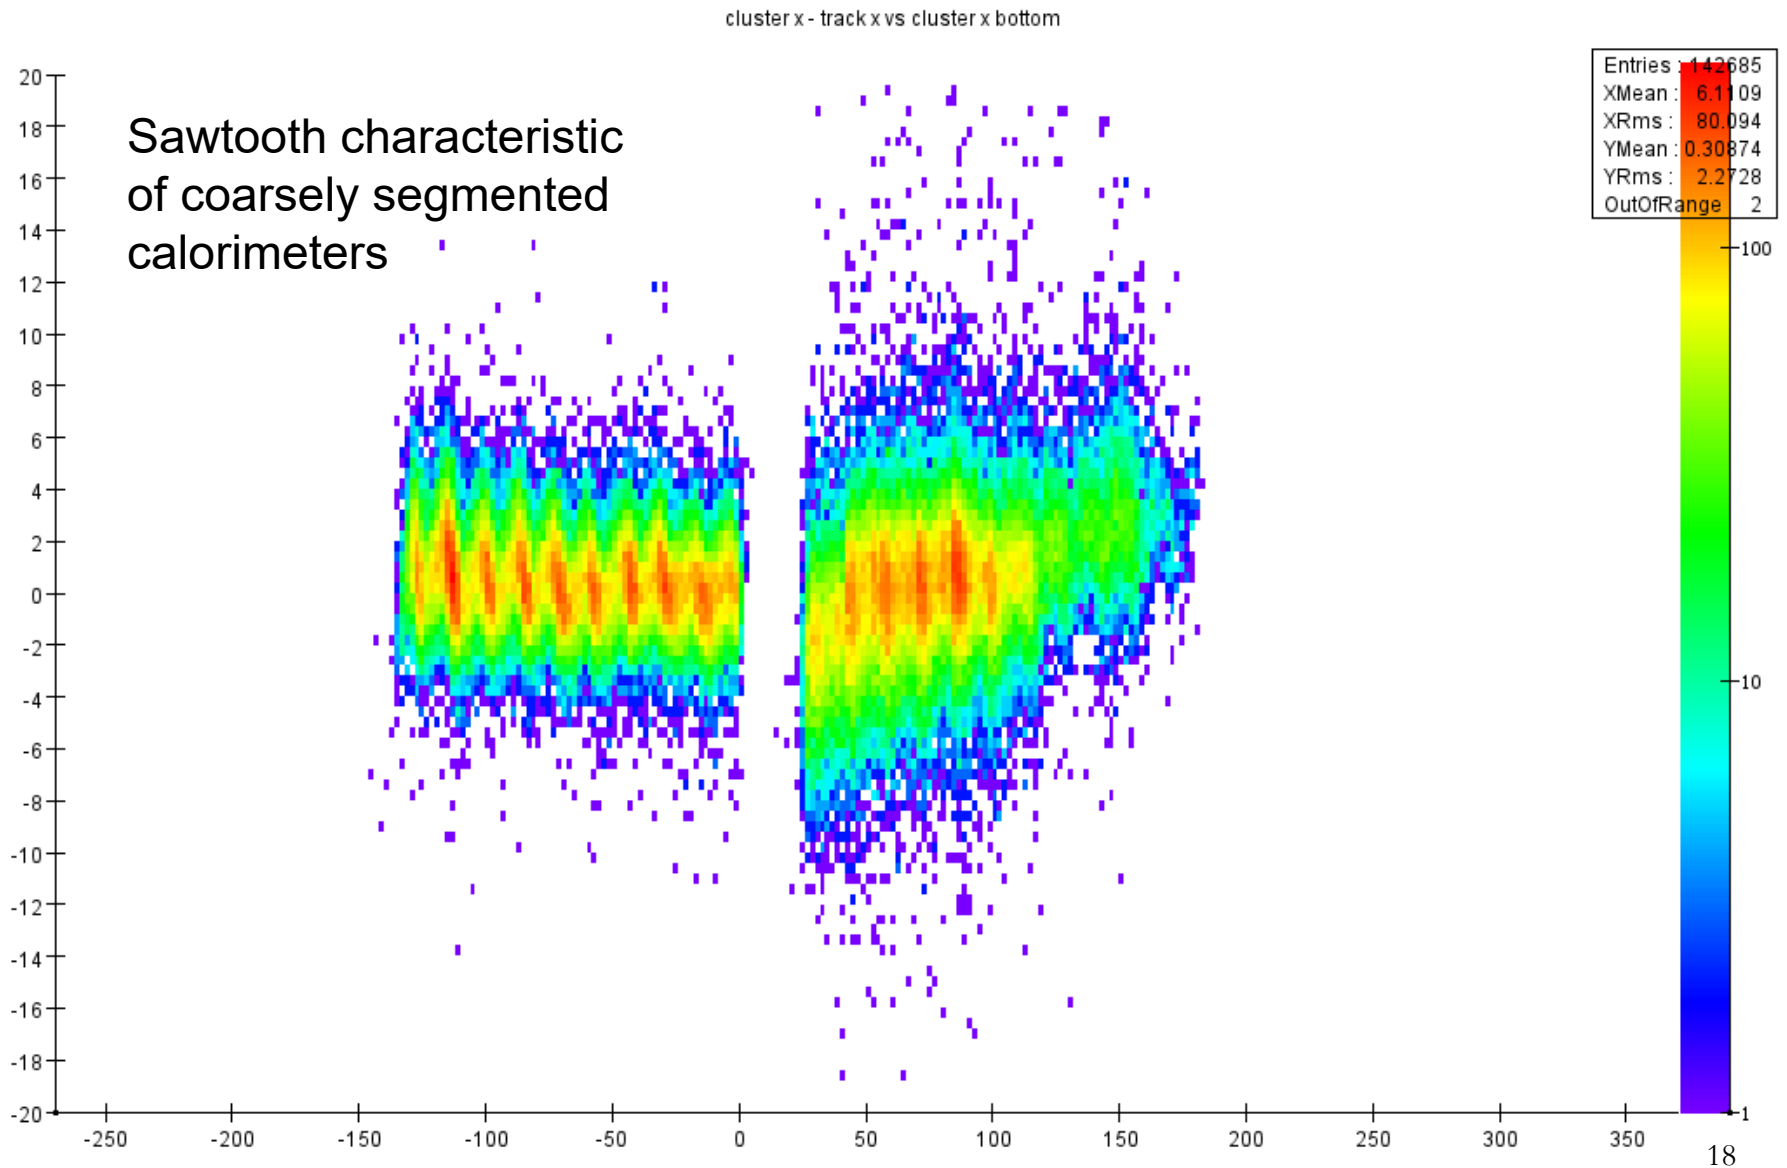

Check other end of track (fiducial)

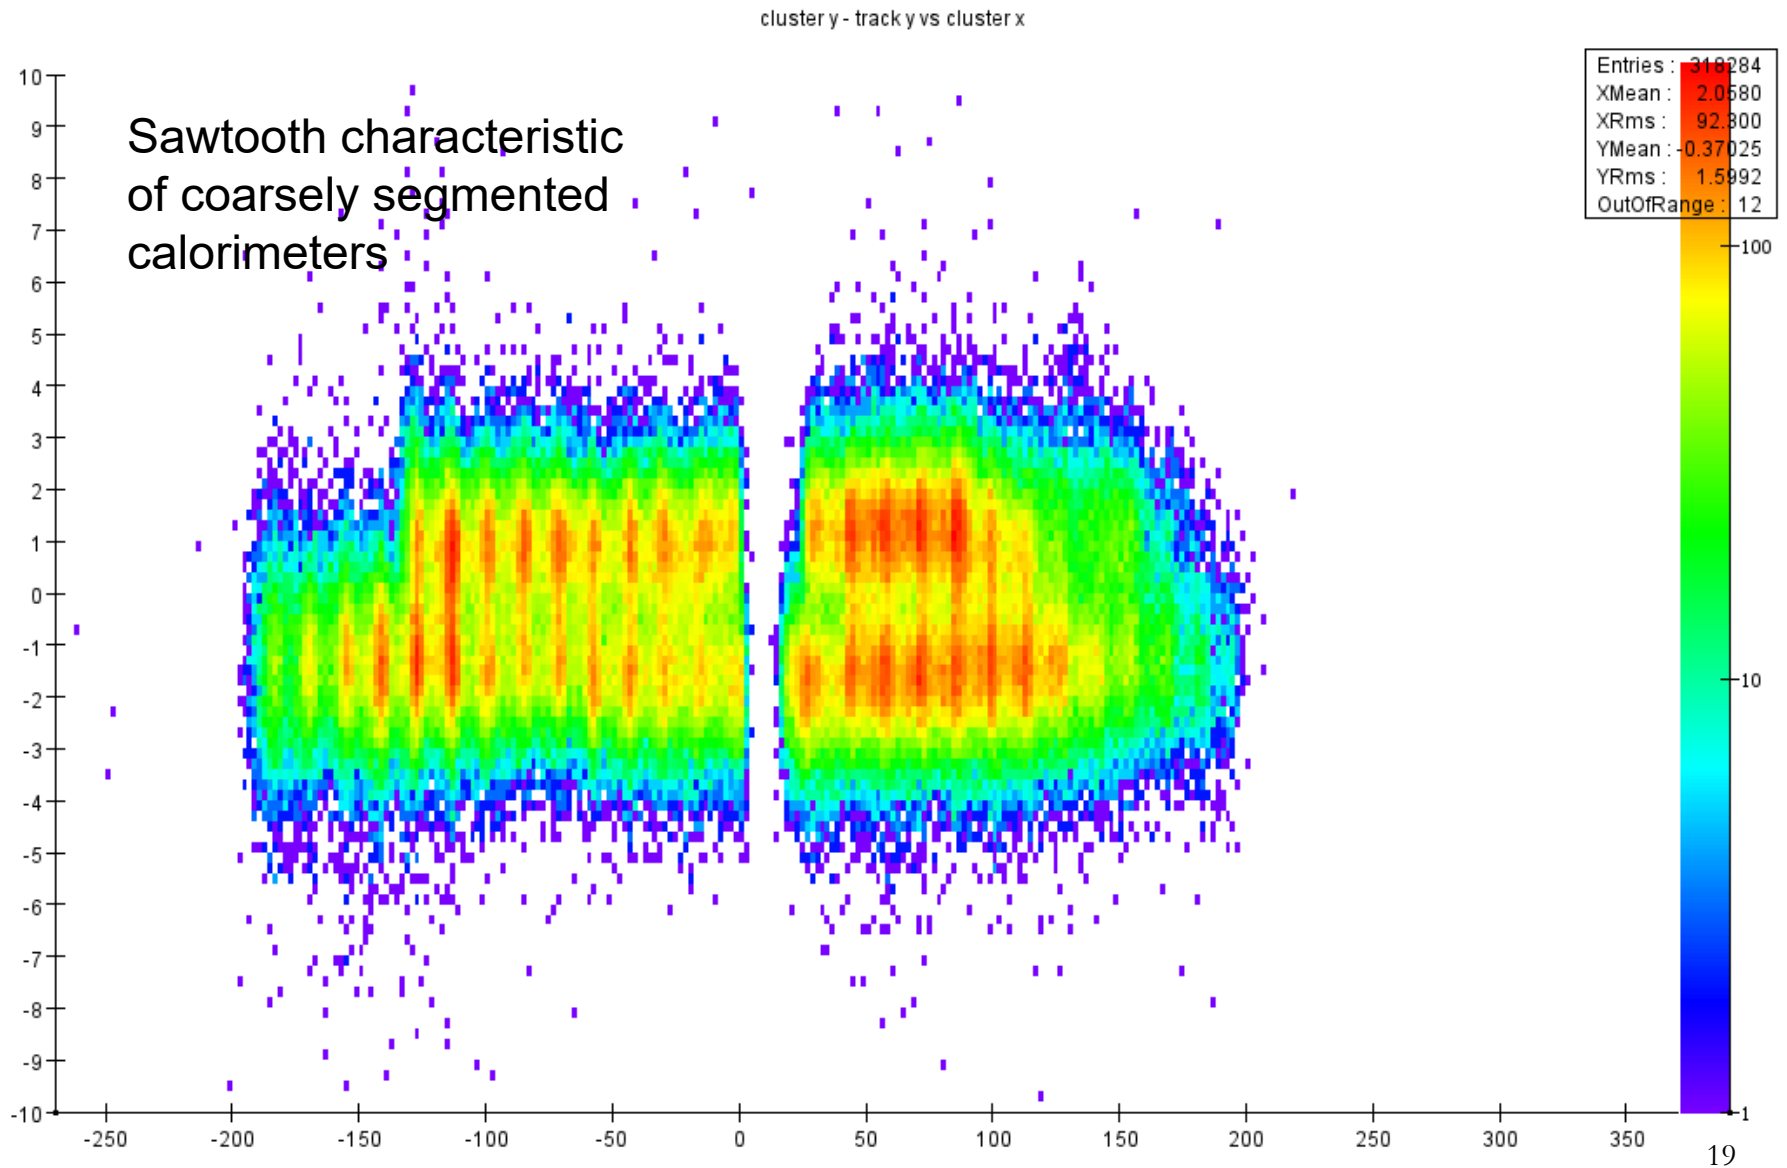

Track X – Cluster X vs X top (fiducial)

Track X – Cluster X vs X bottom (fid)

Track Y – Cluster Y vs X (fid)

Track Y – Cluster Y vs Y (fid)

cluster y - track y vs cluster y

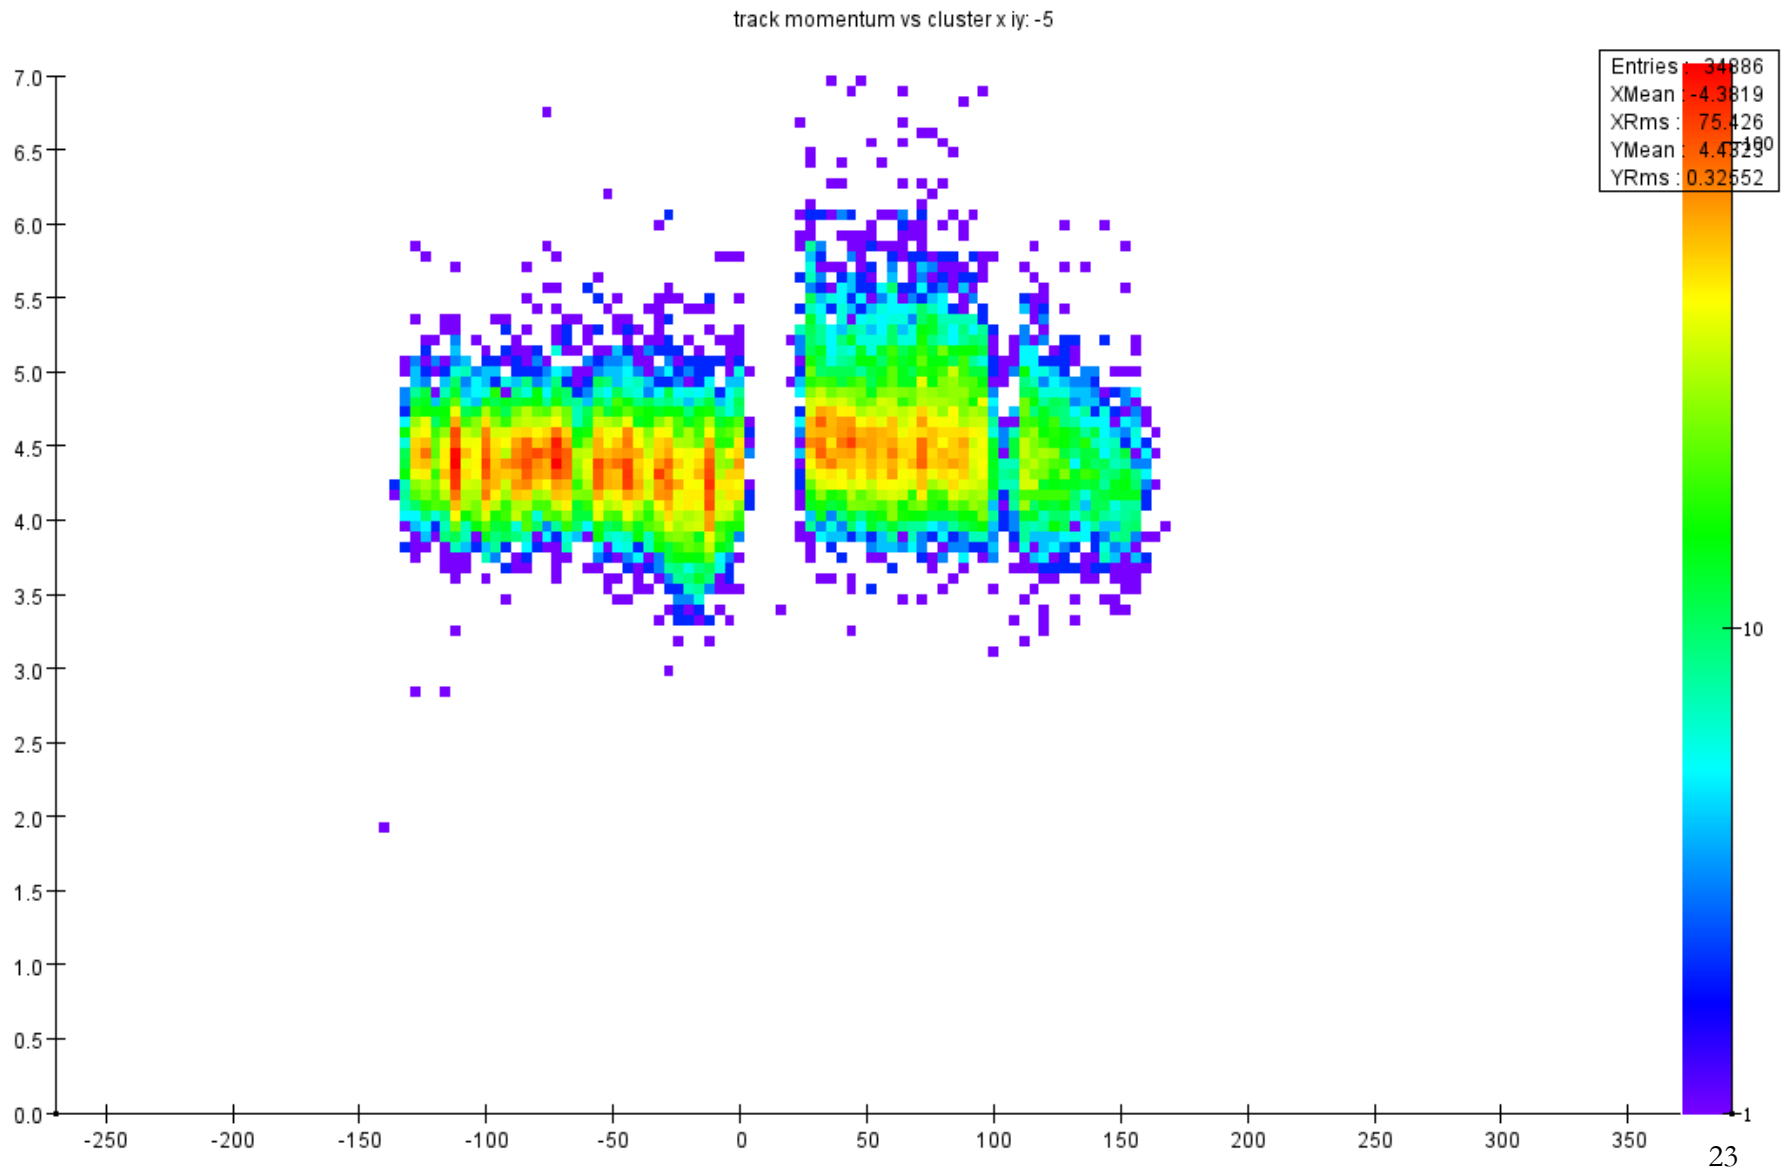

Track-Cluster Matching

- Severe systematics observed when matching tracks to fiducial calorimeter clusters
 - only one quadrant in ΔX looks OK
 - matching in Y is more precise, but mismatch between top and bottom matching on order of 1mm
- Check momentum as function of (x,y) at Ecal
 - have already seen dependence on $\tan\Lambda$ in top
- Analyze track momentum by cluster IX, IY
 - Plot Momentum as function of x for fixed IY

Cluster Index IX, IY

Track Momentum vs X, IY = -5

Track Momentum vs X, IY = -4

Track Momentum vs X, IY = -3

Track Momentum vs X, IY = -2

Track Momentum vs X, IY = -1

Track Momentum vs X, IY = +1

Track Momentum vs X, IY = +2

Track Momentum vs X, IY = +3

Track Momentum vs X, IY = +4

Track Momentum vs X, IY = +5

Momentum Systematics

- Bottom electron (hole) side is reasonably well-behaved
- Bottom positron (slot) side shows shallow dependence on x
- Both electron and positron sides in the top show very strong dependence on x , increasing with y .
- This goes a long way towards explaining the differences we have seen when aligning with FEEs, which tend to populate the small $|x|$ region, and with “physics” e^+ and e^- tracks, which tend to populate large $|x|$
- This behavior is consistent with suggestions of out-of-plane bowing of the double-sensor stations.

Out-of-plane bowing

- Evidence has been presented by PF for z translations of the sensors, but difficult to reconcile with locations of the aluminum mounts
- Bowing of the carbon fiber sensor mounts has recently been forwarded as a possible explanation of this behavior
- Ideal, flat, support for hole and slot sensors

Out-of-plane bowing

- Exaggerated bowing of support
- Telescoping of the detector in z would lower the curvature, and the momentum, with a dependence on x , lower in the middle, higher at the extrema

Out-of-plane bowing

- Need for MC studies to investigate both qualitative and quantitative behavior

Out-of-plane bowing

- Need for MC studies to investigate both qualitative and quantitative behavior
- Difficult to introduce non-planar sensors into our geometry and reconstruction software

Out-of-plane bowing

- Need for MC studies to investigate both qualitative and quantitative behavior
- Approximate non-planar detector with combination of Tz and Ry to place planar sensors on chords of the arc.
