

MC production status update

Sarah Gaiser
Stanford/SLAC
October 22, 2024

- Tritrig events are generated using MG5
 - Cuts on minimum $\tan L$ and energy of leptons

```
0.16 = elminsp      ! min E for l+ & at least one l-
1.6 = eltotsp      ! min total E for l+ & at least one l-
0.01 = mmlminsp    ! min invariant mass for at least one l+l- pair
100.0 = mmlmaxsp   ! max invariant mass for at least one l+l- pair
0.005 = thetaylminsp ! min angle (y direction) for l+ and at least one l-
100.0 = thetaylmaxsp ! max angle (y direction) for l+ and at least one l-
```

- Problem: low p_{sum} distribution in MC different from data
 - Where is this deviation coming from?

Preselected tritrig+pulser vs. data

- Tritrig events are generated using MG5
 - Cuts on minimum $\tan L$ and energy of leptons

```
0.16 = elminsp      ! min E for l+ & at least one l-
1.6 = eltotsp      ! min total E for l+ & at least one l-
0.01 = mllminsp    ! min invariant mass for at least one l+l- pair
100.0 = mllmaxsp   ! max invariant mass for at least one l+l- pair
0.005 = thetaylminsp ! min angle (y direction) for l+ and at least one l-
100.0 = thetaylmaxsp ! max angle (y direction) for l+ and at least one l-
```

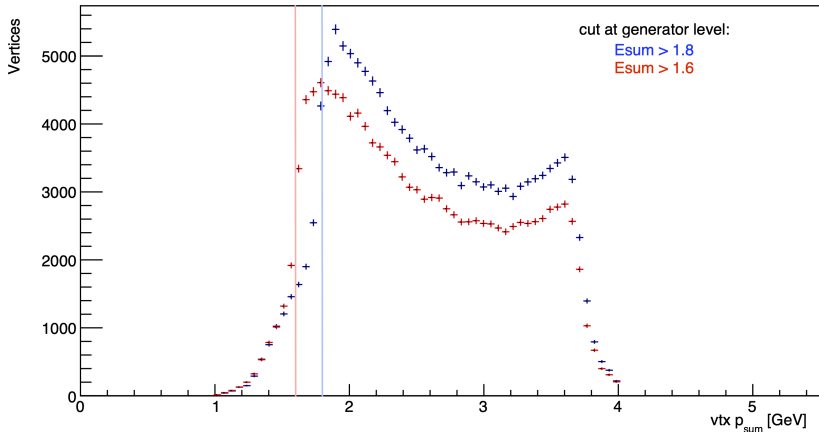

- Problem: low p_{sum} distribution in MC different from data
 - Where is this deviation coming from?

- Tritrig events are generated using MG5
 - Cuts on minimum $\tan\beta$ and energy of leptons

```
0.16 = elminsp      ! min E for l+ & at least one l-
1.6 = eltotsp      ! min total E for l+ & at least one l-
0.01 = mllminsp    ! min invariant mass for at least one ll- pair
100.0 = mllmaxsp   ! max invariant mass for at least one ll- pair
0.005 = thetaylminsp ! min angle (y direction) for l+ and at least one l-
100.0 = thetaylmaxsp ! max angle (y direction) for l+ and at least one l-
```

- Problem: low p_{sum} distribution in MC different from data
 - Where is this deviation coming from?
- Missing events at low $e_{\text{sum}}/p_{\text{sum}}$ at generator level
 - Rising edge of distribution around $E_{\text{min}}^{l^+l^-} = 1.6 \text{ GeV}$

Preselected tritrig+pulser – $E_{\min}^{l^+l^-}$ dependence

- Rising edge moves towards higher psum for $E_{\min}^{l^+l^-} > 1.8$ GeV

- Tritrig events are generated using MG5
 - Cuts on minimum $\tan L$ and energy of leptons

```
0.16 = elminsp      ! min E for l+ & at least one l-
1.6 = eltotsp      ! min total E for l+ & at least one l-
0.01 = mmlminsp    ! min invariant mass for at least one l+l- pair
100.0 = mmlmaxsp   ! max invariant mass for at least one l+l- pair
0.005 = thetaylminsp ! min angle (y direction) for l+ and at least one l-
100.0 = thetaylmaxsp ! max angle (y direction) for l+ and at least one l-
```

- Problem: low p_{sum} distribution in MC different from data
 - Where is this deviation coming from?
- Missing events at low $e_{\text{sum}}/p_{\text{sum}}$ at generator level
 - Rising edge of distribution around $E_{\text{min}}^{l^+l^-} = 1.6 \text{ GeV}$

- Tritrig events are generated using MG5
 - Cuts on minimum $\tan L$ and energy of leptons

```
0.16 = elminsp      ! min E for l+ & at least one l-
1.6 = eltosp        ! min total E for l+ & at least one l-
0.01 = mllminsp    ! min invariant mass for at least one l+l- pair
100.0 = mllmaxsp   ! max invariant mass for at least one l+l- pair
0.005 = thetaylminsp ! min angle (y direction) for l+ and at least one l-
100.0 = thetaylmaxsp ! max angle (y direction) for l+ and at least one l-
```

- Problem: low p_{sum} distribution in MC different from data
 - Where is this deviation coming from?
- Missing events at low $e_{\text{sum}}/p_{\text{sum}}$ at generator level
 - Rising edge of distribution around $E_{\text{min}}^{l^+l^-} = 1.6 \text{ GeV}$
- Naïve solution: move $E_{\text{min}}^{l^+l^-}$ to lower values
 - Try to lower eltosp , but **MG5 fails to generate events** for all $E_{\text{min}}^{l^+l^-} < 1.6 \text{ GeV}$
 - Why? Probably problem with integration over pole in Bethe-Heitler

- How can we access lower momenta?
 - I played around with this for a bit and most things don't work
 - Best failure so far: splitting e^- and e^+ energy requirements

```
1.0 = elminsm      ! min E for at least one l-
0.2 = elminsp      ! min E for l+
100.0 = elmaxsm    ! max E for at least one l-
100.0 = elmaxsp    ! max E for l+
0.1 = eltotsp      ! min total E for l+ & at least one l-
0.01 = mmlminsp    ! min invariant mass for at least one l+l- pair
100.0 = mmlmaxsp   ! max invariant mass for at least one l+l- pair
0.005 = thetaylminsp ! min angle (y direction) for l+ and at least one l-
100.0 = thetaylmaxsp ! max angle (y direction) for l+ and at least one l-
```

- Observations:
 - Need $E_{\min}^{e^-} \geq 1.0 \text{ GeV}$
 - $E_{\min}^{e^+}$ can be low
 - If high $E_{\min}^{e^-}$ given, $E_{\min}^{l^+l^-}$ can be low

Esum at generator level

- Modified MC has more low Esum events, stronger peak at beam energy

E_{e^-} at generator level

- Modified MC has sharp cut at 1.0 GeV as expected
- Standard MC has sharp cut at 2.1 GeV

- Modified MC peaks stronger towards low energies

P_{sum} distribution - comparison MC and data

- Distributions not normalized
- For data: peaks at $p_{sum} = 0.5$ GeV and $p_{sum} = 1.2$ GeV

P_{sum} distribution - Frankenstein

- Data and standard MC not matching for low p_{sum}

P_{sum} distribution - Frankenstein

- Data and standard MC not matching for low psum
- We could piece together the MC distributions as needed
- But probably not worth the effort

Momentum distribution on data and MC

- Looking at momentum distributions (p_{e^-} and p_{e^+}) in data and MC
- Before preselection: find peaks at
 - $p_{e^+} = 0.9$ GeV for data

Momentum distribution on data and MC

- Looking at momentum distributions (p_{e^-} and p_{e^+}) in data and MC
- Before preselection: find peaks at
 - $p_{e^+} = 0.9$ GeV for data
 - $p_{e^+} = 1.0$ GeV and $p_{e^-} = 0.8$ GeV for standard MC

Momentum distribution on data and MC

- Looking at momentum distributions (p_{e^-} and p_{e^+}) in data and MC
- Before preselection: find peaks at
 - $p_{e^+} = 0.9$ GeV for data
 - $p_{e^+} = 1.0$ GeV and $p_{e^-} = 0.8$ GeV for standard MC
 - $p_{e^+} = 1.1$ GeV and $p_{e^-} = 1.0$ GeV for modified MC

- Looking at momentum distributions (p_{e^-} and p_{e^+}) in data and MC
- Before preselection: find peaks at
 - $p_{e^+} = 0.9$ GeV for data
 - $p_{e^+} = 1.0$ GeV and $p_{e^-} = 0.8$ GeV for standard MC
 - $p_{e^+} = 1.1$ GeV and $p_{e^-} = 1.0$ GeV for modified MC
- Cuts on $E_{\min}^{e^-}$ change shape of momentum distribution
 - This is really not surprising...
- ‘Peak’ around 1.0 GeV from trigger threshold at 0.5 GeV

- What about switching electron and positron energy requirements?

0.2 = elminsm	! min E for at least one l-
1.2 = elminsp	! min E for l+
100.0 = elmaxsm	! max E for at least one l-
100.0 = elmaxsp	! max E for l+
0.1 = eltotsp	! min total E for l+ & at least one l-
0.01 = mmlminsp	! min invariant mass for at least one l+l- pair
100.0 = mmlmaxsp	! max invariant mass for at least one l+l- pair
0.005 = thetaylminsp	! min angle (y direction) for l+ and at least one l-
100.0 = thetaylmaxsp	! max angle (y direction) for l+ and at least one l-

- What about having both at mid-low energies?

0.8 = elminsm	! min E for at least one l-
0.5 = elminsp	! min E for l+
0.1 = eltotsp	! min total E for l+ & at least one l-

- Observations:

- Need $E_{\min}^{e^+} \geq 1.2 \text{ GeV}$ so that $E_{\min}^{e^-}$ can be low
- $E_{\min}^{l^+l^-}$ can be low

Esum at generator level

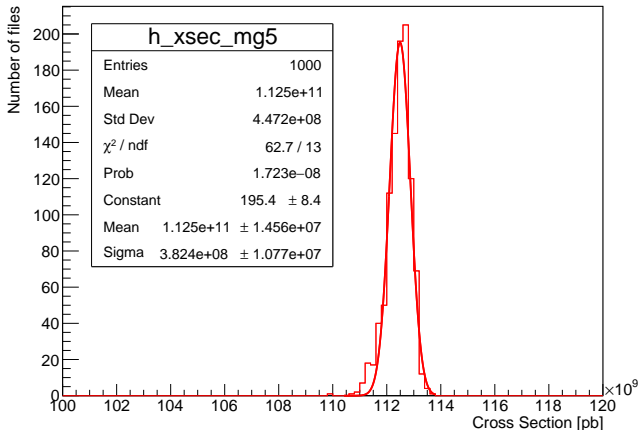

E_{e^-} at generator level

E_{e^+} at generator level

Switching gears – generated cross sections

■ $\sigma_{\text{gen}}^{\text{WAB}} = 1.125 \times 10^{11} \text{ pb}$

Switching gears – generated cross sections

- $\sigma_{\text{gen}}^{\text{WAB}} = 1.125 \times 10^{11} \text{ pb}$
- $\sigma_{\text{gen}}^{\text{tritrigrig}} = 6.871 \times 10^8 \text{ pb}$

- WAB

- generated events: $300 \times 10 \times 10\,000 = 3 \times 10^7$
- events post preselection: 3251
- effective xsec: $\sigma_{\text{eff}}^{\text{WAB}} = \sigma_{\text{gen}}^{\text{WAB}} \times \frac{3251}{3 \times 10^7} = 1.219\,125 \times 10^7 \text{ pb}$

- tritrig

- generated events: $50 \times 10 \times 10\,000 = 5 \times 10^6$
- events post preselection: 129 920
- effective xsec: $\sigma_{\text{eff}}^{\text{tritrig}} = \sigma_{\text{gen}}^{\text{tritrig}} \times \frac{129920}{5 \times 10^6} = 1.785\,361 \times 10^7 \text{ pb}$

- ratio WAB : tritrig = 0.406 : 0.594

- Statistics are too low still to reasonably use WAB MC

- Statistics are too low still to reasonably use WAB MC
- Most events are cut out at $p_{e^-} > 0.5$ GeV and $p_{e^+} > 0.5$ GeV
 - Lots of low momentum tracks reconstructed

- Generate bigger WAB sample
 - I didn't pay as much attention to this as I should have during the last two weeks...
- I could generate test samples for different tritrig generator configs
 - Takes a lot of time and might be pointless
 - Could also make lower psum accessible to us

Preselection cutflow

- Comparison of cutflow for data, standard, and modified MC

Momentum distribution – data

- Distributions with and without preselection cuts

Momentum distribution – standard MC

- $E_{\min}^{l^+l^-} = 1.6 \text{ GeV}$ and $E_{\min}^{l^+/-} = 0.16 \text{ GeV}$
- Distributions with and without preselection cuts

Momentum distribution – new MC

- $E_{\min}^{-} = 1.0 \text{ GeV}$, $E_{\min}^{+} = 0.2 \text{ GeV}$, and $E_{\min}^{l^{+}+l^{-}} = 0.1 \text{ GeV}$
- Distributions with and without preselection cuts
